I think the original poster may not have realized that in ham jargon, "HITTING" a repeater, means that you are able to transmit to it and have it respond... a la a "kerchunk" or a repeater ID. He may simply have meant that he can -hear- the repeater. And, I'll give him the benefit of the doubt, as a newbie.

But, now, I'll presume he knows that "hitting" a repeater means -transmitting-.... which means a license is necessary. And, thanks to many on-line resources, it's not hard to study and take practice exams. And, he will then pass the test, get his callsign, and join the ranks!!

Maybe you're right. But I think the poster posting about figuring out the offset and CTCSS has us all thinking otherwise.

Devices marketed as "FRS/GMRS" or "dual-service devices" are available from many manufacturers and many retail or discount stores. The manual that comes with the device, or the label placed on it by the manufacturer, should indicate the service the device is certified for. If you cannot determine what service the device may be used in, contact the manufacturer. If you operate a device that has been approved exclusively under the rules that apply to FRS you are not required to have a license. FRS devices have a maximum power of ½ watt (500 milliwatt) effective radiated power and integral (non-detachable) antennas. If you operate a device under the rules that apply to GMRS, you must have a GMRS license. GMRS devices generally transmit at higher power levels (1 to 5 watts is typical) and may have detachable antennas.

Most of the UV-5Rs I purchases for myself and others, but for two, all came from ebay seller radioshop888. It took approximately 7-8 days.

I purchased one recently via Amazon. Was shipped from inside the USA, and it took about a week.

My very first one was purchased from another ebay seller, who I had bought from before, Solidradio. The only reason I bought the other UV-5Rs from radioshop888 is that when buying from other sellers, I had to buy the UV-5R supplied with the 1800 mah battery, and pay more to buy the 3600 mah battery to go with it. I do not want the 1800's, as the radio is difficult to hold and operate like that. I wanted only the 3600 mah. Radioshop888 sold the UV-5Rs at a reasonable price equipped from the outset with the larger battery. Also, radioshop888 sells the Nagoya NA-701. When I ordered UV-5Rs and ordered the 701 at the same time, they packed them together.

I haven't bought any UV-5Rs from overseas recently, but I have no reservations about dealing with either Solidradio or radioshop888.

95.135 Transmitter power limits.

(a) No station may transmit with more than 50 watts output power.

(b) [Reserved.]

(c) A small control station at a point north of Line A or east of Line C must transmit with no more than 5 watts ERP.

(d) A fixed station must transmit with no more than 15 watts output power.

(e) A small base station must transmit with no more than 5 watts ERP.

95.139 Adding a small base station or a small control station.

(a) Except for a GMRS system licensed to a non-individual, one or more small base stations or small control stations may be added to a GMRS system at any point where radio services are regulated by the FCC.

(b) Non-individual licensees may not add any small base stations or small control stations to their GMRS systems.

My BFB231 does MURS/FRS/GMRS. I tested it into a dummy load and verified
it with my frequency counter. (of course, the stock ducky is a dummy load, too)

I have 10 UV 5R hts. I have the programming cable that came with them. I run CHIRP on 3 different computers all with Widows 7. Only one of the radios will program more then once.... I can read them all. I remove and reinstall the CHIRP and Cable Drivers and it works fine ONE time then I get an error message that radio is not combatable.....taking forever to program....any help? The sofware that came with the radios will not install on any computer.

Subject: [baofeng_uv5r] Technician license?

First let me say something topical. I purchased a UV-5R about a
month ago and like it very much.

My real question is, I took and passed my Technician exam almost 2
weeks ago and it is STILL not posted in ULS! How long should it
take? Do these Amateur clubs send in your test results via snail
mail??? When I applied for my GMRS license it was posted 24 hours
later.
Thanks.

33447. Hacking the UVB5

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-04 01:05:58 UTC
From: <lelazary@...>
Topic: 33447 Message: 33447

Just wanted to share some information on hacking the UV-B5. I know there is a separate group for that radio, but the original hacking of the UV-5R started here, so I am posting the information here as well (and since the radio are very similar to each other).

Bottom line, is that the UV-B5 is a much simpler hack since they have separated the CPU from the radio with a cable. Also, the programming pads on the CPU are exposed, but I have not been able to program the CPU (maybe I have the wrong protocol).
You can read more on the hacking progress here:
http://www.elazary.com/index.php?option=com_content&view=article&id=53:hacking-the-uv-b5&catid=14:baofeng-uv5r&Itemid=17

They operate just like all branches of the government including the military. Out of 10 people 3 don't do anything close and waiting for retirement, out of the remaining 7, 4 cannot be fired so do not do much of anything. That leaves 3 left to do all the work.

First let me say something topical. I purchased a UV-5R about a

month ago and like it very much.

My real question is, I took and passed my Technician exam almost 2
weeks ago and it is STILL not posted in ULS! How long should it
take? Do these Amateur clubs send in your test results via snail
mail??? When I applied for my GMRS license it was posted 24 hours
later.
Thanks.

Lior,

I must say, you’re a friggin stud.

So, aside from making the radio sending Morse code, after all that work, what have you been able to get the UV-5R+ to do?

What would be interesting is to make it somehow interface for SSB modes like RTTY or other data communications, remote control via internet ? Point to point data on 440? Not sure what else would be functionally interesting

What is the hacking group?

Michael K3MH

Subject: [baofeng_uv5r] Hacking the UVB5

Just wanted to share some information on hacking the UV-B5. I know there is a separate group for that radio, but the original hacking of the UV-5R started here, so I am posting the information here as well (and since the radio are very similar to each other).

Bottom line, is that the UV-B5 is a much simpler hack since they have separated the CPU from the radio with a cable. Also, the programming pads on the CPU are exposed, but I have not been able to program the CPU (maybe I have the wrong protocol).
You can read more on the hacking progress here:
http://www.elazary.com/index.php?option=com_content <http://www.elazary.com/index.php?option=com_content&view=article&id=53:hacking-the-uv-b5&catid=14:baofeng-uv5r&Itemid=17>

Jim, I'm a W5YI CVE. I gave tests on a Tuesday evening, double checked all of the paperwork Wednesday morning, and snail mailed it in. At W5YI, for new Techs, we also email scans of the test answer sheets, and other paperwork, and the nice folks in Dallas process the paperwork right away. Our new Techs were listed on the ULS Thursday night.

They do that, submitting to the FCC using scans emailed so that they will be listed on the ULS and can get on the air as soon as possible. For those advancing to General or Extra, they already have a call sign and can operate with their new license privileges right away, with suffix to their call sign indicating they are an acting General or Extra. But a new Tech cannot do this because he has no call sign yet. So, they rush it as much as possible. (They still must receive the snail mailed hard copies of the paperwork.)

When I was licensed I took the tests on a Saturday morning at a hamfest, and was listed on the ULS sometime on the following Thursday.

So, it CAN be done faster.

And let me add... welcome to Ham Radio!

73,

Paul - AE5JU

PS, keep working on that General.

Hello, sorry for asking such a stupid question, but am I the only one having trouble accessing the REPEATER & FREQUENCY LISTS - CHIRP image & VIP dat file folder?

It just says that it's an invalid folder

You are not alone. Both folders with the "&" character in the name are unavailable.

Has anyone here tried HamTestOnline.
http://www.hamradiolicenseexam.com/
What do you think of it, is it as good as it says?

I found a place where I can take the exams for $5 at the end of the month. :-)

Right now I can ace the Technician Class exam.
I pass and sometimes ace the General Class exam.
So I'm thinking why not go for the Extra Class exam.

The Extra Class questions are hard. I now know all the things I forgot over the years. :-(
Its $34.95 for the Extra Class study course. It seems a bit expensive but if it works maybe I'll go for it. How much info beyond the questions and answers do you get at HamTestOnline?

Thanks in advance for all your input. :-)

They have reference info for all the questions so you can actually learn the theory behind the question (at least for those that aren't rote memorization like frequencies).

I can recommend it highly. I'm studying for the extra class now with them.

Time to post seems to very. I know our VE team it has been averaging at most two weeks from the test date using the ARRL. Of course with holidays that might be a bit longer, but for the most part we have not had a test close enough to a holiday that we have not been effected by that. Other VECs may take longer. I know another club that uses W5YI seems to take longer (1 Month maybe) but there may be other reason behind that like not submitting paper work the next day like we do, using regular mail rather than priority. The unfortunate thing is these submissions are old school and are all on paper not electronic so they take longer.

The stock antenna is like a dummy load. The 701 works like an antenna. :-). I just ordered the 771 that will arrive this week. I like the length of the 701, not too long.

Is there a decent short rubber duck antenna that anyone would recommend?

Let me clarify, I know what Kerchunking (SP) is and I was NOT doing that. By hitting I simply meant I could hear "stuff" on the HT.

Ray was right, I was just listening in and I thought I had to get all of the settings correctly to hear traffic on a repeater as they seemed very quiet. I was expecting to hear people talking ;-) I also found NOAA and raliezed that I had done something right, finally. I don't have a mentor so its all trial, error and youtube so far.

Ok, back to the facts, I was able to listen to the hourly message from the Redwood city repeater and listen into a "net" in palo alto at 9am (and found their web site also).

I know that technically pressing the talk button is not approved without a license and I have done my research. I am studying now and hope to take my test in a few weeks. I wish there was an online place I could take it but haven't found one yet.

Thanks for the input and sorry that you assumed I was violating the rules with my question.

Scott

Subject: [baofeng_uv5r] Technician license?

First let me say something topical. I purchased a UV-5R about a

month ago and like it very much.

My real question is, I took and passed my Technician exam almost 2 weeks ago and it is STILL not posted in ULS! How long should it take? Do these Amateur clubs send in your test results via snail mail??? When I applied for my GMRS license it was posted 24 hours later.
Thanks.

Scott,

I knew what you meant. But the context of "hitting" a repeater normally
means that you have been able bring the repeater up by transmitting to it.

If you haven't already, what you need to do it get a programming cable and
either the Baofeng or CHIRP software. That way you will be able to program
the channels with TX inhibited to prevent accidental transmissions. With
CHIRP you can disable the VFOs, too.

Date: 2013-09-04 17:11:43 UTC
From: <lelazary@...>
Topic: 33447 Message: 33486

> So, aside from making the radio sending Morse code, after all that work, what have you been able to get the UV-5R+ to do?

I have a wish list on the UV3R of what I want the radio to do.
https://github.com/lelazary/UV3RMod/blob/master/WISHLIST
So far I have RTTY and GMSK (http://groups.yahoo.com/group/baofeng_uv5r/message/19833) working (actually any mode using FSK or PSK see http://www.elazary.com/index.php?option=com_content&view=article&id=50:txrx-digital-data-using-the-uv5r&catid=14:baofeng-uv5r&Itemid=17). I have also used it as a field strength meter to measure antennas and as a hound for fox hunting (you can get a resolution of 1/8dB). For fox hunting I have the signal go into the speaker as a tone, so we can hear when you are facing the fox. I also have it as a fox sending my call sign over Morse every predefined interval. Lastly, I have been working on a Morse trainer for people, so you can send it Morse code, and it would reply automatically.

However, it have been very difficult to implement some of these things on the UV3R due to the memory constrains (only 16K). This is why the UV-5R was a better platform, but you needed to remove the CPU, which was difficult. Once I have the board built, the UV-B5 should be a very easy hack out of the UV-5R and UV-3R.

Lior.

Lior,

I must say, youâ□□re a friggin stud.

So, aside from making the radio sending Morse code, after all that work, what have you been able to get the UV-5R+ to do?

What would be interesting is to make it somehow interface for SSB modes like RTTY or other data communications, remote control via internet ? Point to point data on 440? Not sure what else would be functionally interesting

What is the hacking group?

Subject: [baofeng_uv5r] Hacking the UVB5

Just wanted to share some information on hacking the UV-B5. I know there is a separate group for that radio, but the original hacking of the UV-5R started here, so I am posting the information here as well (and since the radio are very similar to each other).

Bottom line, is that the UV-B5 is a much simpler hack since they have separated the CPU from the radio with a cable. Also, the programming pads on the CPU are exposed, but I have not been able to program the CPU (maybe I have the wrong protocol).
You can read more on the hacking progress here:
http://www.elazary.com/index.php?option=com_content&view=article&id=53:hacking-the-uv-b5&catid=14:baofeng-uv5r&Itemid=17

Do you not consider the 701 to be a Rubber Duck?

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com] On Behalf Of Paul Nourse

Subject: Re: [baofeng_uv5r] RE: Antenna Upgrade eBay help

The stock antenna is like a dummy load. The 701 works like an antenna. :-). I just ordered the 771 that will arrive this week. I like the length of the 701, not too long.

Is there a decent short rubber duck antenna that anyone would recommend?

Highly recommended by everyone that's used them (including the XYL who passed her General two months ago using it). Read the reviews at eham. Besides, it's the only study guide that guarantees you'll pass or your money back. I wish I had known of it before I sat down to study for my Extra.

33489. Mirage BD-35 VHF/UHF amplifier

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-04 17:28:01 UTC
From: <renaissance.man.universalis@...>
Topic: 33489 Message: 33489

Has anyone tried using the UV-5R with the Mirage BD-35 VHF/UHF amplifier? Since the radio is only $32 and the amp is $170, I'm worried that the radio might damage the amplifier since it transmits out of range.

You can always change the limits on your radio to prevent accidentally going out of its specified band.

Scott,

Depending on how much your testing team follows the rules, be sure to bring
your actual driver's license (or some form of picture ID). You'd be
surprised how many folks don't remember and then get turned away.

Kerchunking is universally recognized as inappropriate behavior (as well as being a violation of the amateur radio rules in at least the US and Canada)

No licensed ham with even 1% of a brain would ever recommend kerchunking (although many hams with about that much brain would DO it even though they know it is both rude and illegal)

From: Ray

'Kerchunking' is a legitimate way of quickly checking your ability to open a repeater.

It does not take up any time or involve lots of inane chatter.

I say go for it.

Ray

33500. Re: [baofeng_uv5r] Connecting the Radio to the Computer for SSTV

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-04 20:03:07 UTC
From: Xaun Loc
Topic: 33365 Message: 33500

You could connect the receive audio output from the radio to the computer to let the computer process received SSTV signals, but the UV-5R would be an extraordinarily bad choice for transmitting SSTV – there is some variation between individual radios but no UV-5R that I have seen or heard of will withstand the 100% duty cycle of SSTV long enough to transmit much of an image. These radios tend to overheat after about one minute of continuous transmit.

From: Michael Boensch
I have the UV-5R and I would like to make a cable to connect to computer audio card so I can use it for the SSTV. I have purchased 6 foot cable from 3 Old Crows but I am not sure if I need an audio transformer to isolate the signals between the computer and the radio. Thanks for your help.

Hi Paul -

I totally credit my Amateur Extra ticket to HamTestOnline. Like you, there was SO much technical information that I had forgotten, and the computer-assisted drilling on my weak areas really helped me out. If I remember correctly, there is a certain amount of background information offered for most questions, but you may have to dig deeper in other resources to really grasp some of the concepts.

The bottom line... It was worth it to me.

73 and good luck,
John - AC4JK

The UV-5R is a poor choice for this. They desense at the drop of a hat. Having a TX & RX that close is not going to work well at all. The receiver on the UV-5R is pretty bad compared to the one in the radio you see in this video. Also, did you notice that he mounted the radio's heat sink directly to the ammo case shell? That is going to increase the duty cycle of the radio. The duty cycle of the UV-5R is rather poor, and there is no externally accessible heat sink (except possibly -- and poorly -- the antenna housing).

I would not buy a $50 Baofeng for this when a $10 used radio will work much, much better.

I would say no, simply because the UV-5R isn't designed to take the heat build-up of any extended transmit times, especially at higher power.

Absolutely! No license to Extra in 6 days.

dan
try this link for the mag mount antenna
http://www.americanradiosupply.com/opek-vum-201-bnc-vhf-uhf-dual-band-mobile-ham-radio-antenna/

like i said the actual antenna you get doesnt have that upper twist..but mine perform excellent.i have people ask if im really on my ht and not my mobile.

Dan,
I'm probably not the best person to ask, but originally I bought
this:
<http://www.powerwerx.com/two-way-radios/handheld-wouxun-radios/magnetic-mount-antenna-coax-cable-standard-sma.html>.
It performed excellently for 2 weeks but then like an absent
minded idiot I entered a car wash and forgot to remove the
antenna. It would have been nice if the car wash folks had pointed
that out to me but they didn't. The car wash ate the antenna and I
m grateful I did not have a radio connected to it at the time as
it sucked all the coax out of the car and I was left with only the
terminating connector. I guess I'm also happy that none of the
cable was wrapped around my leg or gear shift at the time! My
bad.
So then I purchased this one which I still have:
<http://www.amazon.com/gp/product/B00DTQ4A6M/ref=oh_details_o01_s00_i00?ie=UTF8&psc=1>
Both of these are better than the original equipment rubber duck
or the NG-701.

I have used HamTestOnline and think they are very good for test studying. It took me one week to prep for the General test using them. I think it's worth it if you are willing to dedicate 30 minutes or so a day to study time.

I took a few practice tests from QRZ.com then passed the
Technician test with 33 of 35 correct. As an EE by education (but
fiber optic network engineer by vocation)I was pleasantly
surprised that I still knew all the stuff pertaining to RF, Power,
and Ohm's Law, but I found the Ham specific questions were easily
solvable via common sense. That's all well and good, but I
actually want to study for the next 2 exams.

Hi Paul -

I totally credit my Amateur Extra ticket to HamTestOnline. Like
you,
there was SO much technical information that I had forgotten, and
the
computer-assisted drilling on my weak areas really helped me out.
If I
remember correctly, there is a certain amount of background
information
offered for most questions, but you may have to dig deeper in
other
resources to really grasp some of the concepts.

The bottom line... It was worth it to me.

73 and good luck,
John - AC4JK

It can be any price from free to $15. In this case they are only charging $5. :-). I'll be going to their club meeting a few days before I take the exam and will probably join then so I can reap the benefits of repeater access.

At this point I can pass the general exam with 0 to 3 wrong IF I read carefully and don't make any stupid mistakes.

I'm about to sign up at "Ham Test Online" for the extra class course.
That course plus other online resources and a study program I downloaded should serve me well.
I am also planning on making flash cards of the few questions I'm having difficulty with.
One tip I will be using is leaving out all the wrong answers. You avoid confusing yourself with the wrong answers.
I find reading the reason and theory behind the questions helps me understand and remember/know the correct answer.

Anyone here with a general class license that also have a general class HamTestOnline course that they no longer have a use for and wouldn't mind lending me access for a few days?

Oh and to the rules are rules people I want you to know I also speed a little over the speed limit. ;-)
Of course not anywhere near as fast as my cop friends or their family's. But I do exceed the posted speed limits. :-)

Paul -

For what it's worth, I'd suggest that you hold off studying for the Extra until AFTER you've passed the General. Some of those Extra questions will mess with your mind!

I accidentally clicked on extra exam instead of general. I was wondering why the questions were so hard. It was then i could feel neurons popping inside my head. ;-) LOL.

Studying the extra class questions seemed to help on the general exam. Many questions from one class exam are related to the next class. I don't like memorizing answers to questions. I prefer to know the answer and use memorization as insurance.

I have until the 28th to study the extra class. Wish me luck. :-)

33523. Group Question - Antenna Connector Spacer

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-05 21:48:52 UTC
From: john_k3nxu
Topic: 33523 Message: 33523

It has been noted that some antennas require a spacer to fill the gap between the antenna base and the radio. I know my Nagoya NA-636 did.
My question is, which antenna do you have (SMA-Female only) and does it require a spacer or not.
Make and Model.
Thanks, John K3NXU

I noticed the antenna connector on the UV-5R is an SMA male. On most other handhelds, it's female.

Is there an adapter or gender changer available or a specially made UV-5R to SO-239 cable so I can hook up a PL-259 connector to the UV-5R?

Yes, a sma male to so239 adapter, or sma to so239 cable. Petty common and easy to find in Amazon, eBay, and various radio vendors.

The famous $3.79 antenna off e-bay fits flat with no spacer needed. Just a hair longer than the Expert Power and both of those work very well for mine.

Nagoya NA-701
J0125A ($3.79 special)
Baofeng UV-B5 stock antenna (arrived today, $4.98 on eBay)

http://hamgear.wordpress.com/2013/02/06/the-baofeng-uv-b5b6-antenna/

all fit without needing a spacer

The 701 fit with just a tiny gap at the bottom. I added an o-ring on the base and its perfect.

Sent from my Verizon Wireless 4G LTE DROID

33537. Small yellow box for uv5r

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-06 03:31:09 UTC
From: Fletch
Topic: 33537 Message: 33537

Awhile back I found a blog that mentioned a waterproff box that fit the the uv5r just perfectly . With the stock ant removed everything fit.

Does anyone know what this box is and where to get it. Would be nice to have another box for pwr supply and charger unit as well.

Off topic: Now that fall is about 2 months away I am going to try and coax friend to help me put up a small rohn tower (20 ft plus mast)

Any recommendations for feed line (about ~75feet) or antenna? I have 4 sections of rohn at parents house. The idea is cut about 4ft off bottom of 1 section and bury it and mount the rest.

Would prefer swing over but will take what I can get.

Thanks Fletch
N4SZO

Fletch,

Regarding the tower, you might want to consider just dropping 4 feet of the first 10 ft. section into the ground without cutting it off first (and of course still using the appropriate amount of concrete for your base), since as soon as you cut it you add another weak point. If (or when) you eventually need to pull the tower down that's when you can cut it. You could even leave the concrete base a few inches below the soil level (and just throw dirt over the top to cover the base after it's cured), so that when you do cut it off in the future you won't even see the tower base.

As for the coax, at 75 ft. signal loss (even on VHF) can be bad (depending on your coax choice), and on UHF it's even worse. Of course if money's no object, it's hard to beat hardline, especially for UHF, but since that's not normally the case for most folks, try to get LMR400. If you are running HF, just about anything from RG-8X and above will work just fine, but using HF rated coax for UHF greatly increases your loss, especially at cable runs over 50 ft.

I'd not be too quick to cover the face of a recessed concrete block with dirt.

I've seen an eighty foot commercial go over cause the moisture and God knows what other chemicals ate through the galvanizing and rotted the metal right where the legs entered the dirt that had overspread the base. The legs within the block still looked to be OK. Probably the local soil composition had something to do with it. Might be smart to talk to other local folks before deciding your course of action.

Yes, I absolutely recommend them. After a week of using that site, I went from missing 15+ questions to missing 1 or 2 and then passed my general 2 weeks later.

I may try this if it comes to that. But what I would really love is what I had before. When I was a kid I did computer/radio repair. Had a customer who made me a home made fold over mount.

3 steel legs with top plate. On top of the plate there were 3 fork legs welded on with holes. He cut 3 holes in bottom of tower and attached with 3 stanless steel bolts. This worked well. Do you think there is anyway I could break up the concrete and remove this mount? This thing is still at my parents house and has been there since early '89 so it is certainly proven itself. Late for work..will reply to the others when I get to work..thanks!

Off topic: Now that fall is about 2 months away I am going to try and coax friend to help me put up a small rohn tower (20 ft plus mast)

Any recommendations for feed line (about ~75feet) or antenna? I have 4 sections of rohn at parents house. The idea is cut about 4ft off bottom of 1 section and bury it and mount the rest.

Would prefer swing over but will take what I can get.

Thanks Fletch

Hello,

Before I got involved with hamstudy.org I used it to help study for my General and Extra exams 4 years ago. Since then I've become a developer for hamstudy.org and we're working really hard at improving the site, and it's come a long way since then!

We have a flash card feature that will automatically help you work on weak areas as you're answering the questions. If you're browsing the question pool you can hide the wrong answers (Distractors) so you only get to see the right answers.

Most of the other handhelds have a DC power jack, but the Baofeng doesn't. Has anyone figured out a way to jerry-rig the UV-5R to be powered externally, without a battery?

Buy the Baofeng Battery Eliminator, insert it instead of a battery and
power it with 12 VDC.

Stan,

You are correct about checking your soil, but there are a number of ways to elevate the problem. In my particular case, the soil in southern AZ doesn't seem to cause any issue with Rohn towers, but I freely admit that Fletch needs to check his area. In my case, we simply left the area base (that was about three inches below ground level) clear of everything until years later when we cut the legs, then filled in the area with dirt, which magically made the entire tower base disappear. Kept dirt out of the area with a simple edging material available at Home Depot or Lowes.

Fletch,

Removing any concrete base can be done (with enough time, manpower, and tools), but it's usually not easy, nor (IMHO) worth the effort. As others have pointed out, you can purchase various Rohn tower base accessories that would help you avoid wasting 3 to 4 ft. of tower section for your base, and if you have the spare coin, that's the route I would take. You may find, however, that the cost of many of the Rohn items (to avoid having to waste 3 to 4 ft. of your tower section) cost as much as a tower section.

Yes, buy a battery eliminator and use it with a power supply that has a
cigarette lighter plug.

I read reviews for a couple of these battery eliminators on Amazon (by different suppliers). A lot of people say they overheat very quickly (check review links below).

http://www.amazon.com/ Etekcity-Battery-Eliminator- Simulator-BAOFENG/product-reviews/B00AI95DI2/ref=cm_cr_ dp_qt_hist_two?ie=UTF8& filterBy=addTwoStar& showViewpoints=0 (http://www.amazon.com/Etekcity-Battery-Eliminator-Simulator-BAOFENG/product-reviews/B00AI95DI2/ref=cm_cr_dp_qt_hist_two?ie=UTF8&filterBy=addTwoStar&showViewpoints=0)

http://www.amazon.com/ EarlyBirdSavings-Battery- Adapter-Eliminator-Baofeng/product-reviews/B009RCQWLI/ ref=cm_cr_pr_viewpnt_sr_1?ie= UTF8&filterBy=addOneStar& showViewpoints=0&sortBy= bySubmissionDateDescending (http://www.amazon.com/EarlyBirdSavings-Battery-Adapter-Eliminator-Baofeng/product-reviews/B009RCQWLI/ref=cm_cr_pr_viewpnt_sr_1?ie=UTF8&filterBy=addOneStar&showViewpoints=0&sortBy=bySubmissionDateDescending)

Can anyone recommend a specific unit that runs cool?

You already have a GMRS license, so try searching for all licenses under your FRN. That should show it if it has been issued.

We haven't had that issue with our units, but we're no longer buying them at the lowest pricing on the web either. Try Kurt at Three Old Crows and you should be fine, just don't try running your unit at high power for 30 minutes at a time without a break, as the UV-5R radio itself will have issues.

If he doesn't have the call by now, he either didn't pass, or the testing team forgot to mail his paperwork in, or the USPS lost the paperwork, or the folks at the FCC are taking an extended "work break".

I voting for either of the two government agencies involved (the USPS or the FCC) to have dropped the ball someplace.

What does Rohn have that would work equivalently?. I wish I could get
the old mount out of the ground as the holes are already cut in the
tower legs for it.

But I am guessing this would take some kind of jackhammer which I do not
have.

I am planning going up with 20ft of tower (25g + 20 g top section) and a
10 ft mast so I don't need super strong. Also want this for easy access
to roof.

Buy the 3800mAh battery and the coax-plug charger for it. The battery itself has the dc jack. Much cheaper than the battery eliminator if you do not have a PS with a cigarette lighter outlet.

33564. Programming with Baofeng software

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-06 19:47:49 UTC
From: <n3ik2000@...>
Topic: 33564 Message: 33564

I recently purchased two UV5R plus HT;s and have managed to program some simplex channels manually. I have tried to get repeaters programmed only to be frustrated!!!!
So downloaded Baofeng software and can get it to come up, but I get an error message saying error 8020? After trying to get it to work, finally was able to write data into the spread sheet. However, the program stopped running and I am unable to re-start it.
Anyone who can hold my hand on this? I have several other radios which I have no trouble programming, but these are giving me a fit! I am not an avid FM op and thought this would be inexpensive way to get on with a ht for local contacts.
Help! and tnx
N3IK, Ike

Well, since it is actually a charging plug for a 2C 3800mAh Li-Ion battery pack I don't think just a voltage requirement is the only thing one should look at. Charging a Li-Ion battery should be done only using an appropriate charger for safety and battery life. According to the Battery University the battery should not be used or discharged while being charged so using a 3800mAh battery and a charger in place of a battery eliminator would not be recommended.

I would recommend looking at the following web sites for details about charging Li-Ion batteries.

http://www.powerstream.com/li.htm

http://www.batteryubiversity.com

You can purchase battery emulators on Amazon that allow you to plug in with
a cord.

I was trying HamTestOnline. I combined tech, general and extra. When through the 50 free tech and general questions and 2% of the extra before I ran out of steam. I work nights and its past my bedtime. ;-) I'll finish up tomorrow then spring for the extra class course. Its nice to get more than a practice exam.

LOL well mine does too, along with my scanner. Why? Because basically the car "shuts off" the accessory plugs while starting in order to send all available power to the starter and engine electronics.

How long ago was it that the test was took? It took mine 3 weeks before it showed up on FCC and then it took a week and half longer for it to show up in the mail. So from the time I took the test to the time I got my licence in the mail it was 4 1/2 weeks. It should only take 14 days to show on fcc and then another week after that for mailing for a total of 3 weeks. The one VE that had done the testing did not get them turned in due to family thing. Thats why it took so long for mine. I would call the VE or Club that did the testing and ask whats going on they will be able to check on it better. Also this is why you get a signed copy of the cert you have for passing. IN case it was to get lost in the mail.

You can find the small Pelican cases in quite a range of colors, including yellow, blue, red, as well as the usual black. Some have clear lids. All have a rubber seal and are fully waterproof.

These sizes are usually sold for cell phones, games, and other small devices. Exactly which one you need depends on whether you have the standard 1800 mah battery, or the extended size 3600 or 3800 mah battery, which other items you need to store with the radio.

>Well, since it is actually a charging plug for a 2C 3800mAh Li-Ion battery pack I don’t think just a voltage requirement is the only thing one should look at. Charging a Li-Ion battery should be done only using an appropriate charger for safety and battery life. According to the Battery University the battery should not be used or discharged while being charged so using a 3800mAh battery and a charger in place of a battery eliminator would not be recommended.

PLEASE DON'T QUOTE BACK AN ENTIRE DIGEST!
We've already read all those messages anyway.

33577. RE: Re: [baofeng_uv5r] Re: Comment On Delay Having New License Posted

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-07 00:24:07 UTC
From: <lnisenoff@...>
Topic: 33463 Message: 33577

For what it's worth, I took my Technicians exam on a Saturday and my call sign was in the database by 9:45am on Monday. I took my General exam on a Tuesday evening and the ULS showed the update about noon the next day. Both exams were conducted by the Laurel VEC and I believe they submit everything electronically.

Does anyone remember when Ben F. Waple and C B Plummer chiseled your license in stone?

John K3NXU

On Sep 6, 2013, at 6:39 PM, KF5ULI <angiharrover@...> wrote:

How long ago was it that the test was took? It took mine 3 weeks before it showed up on FCC and then it took a week and half longer for it to show up in the mail. So from the time I took the test to the time I got my licence in the mail it was 4 1/2 weeks. It should only take 14 days to show on fcc and then another week after that for mailing for a total of 3 weeks. The one VE that had done the testing did not get them turned in due to family thing. Thats why it took so long for mine. I would call the VE or Club that did the testing and ask whats going on they will be able to check on it better. Also this is why you get a signed copy of the cert you have for passing. IN case it was to get lost in the mail.

the channels in the scan group (the voice prompt with say "scan begin").

Manually programmed channels are always in the scan group. You have to use
software to remove a channel from the scan group.

Ya some do electronically some do snail mail. You can tell the ones that go
the snail mail route. Avg time wait though is 2 to 3 weeks.

this is according to the main FCC when I called them earlier this year.

Ben F. Waple's signature (part of form) as FCC Secretary was on my Novice ticket WN5WGJ in July 1968, WA5WGJ Technician in June 1969, and WA5WGJ Advanced in August 1970. But not KK5F Amateur Extra in August 1980.

Jim give it time remember Monday was a holiday and the time frame is working days. My friends just took 3 weeks and another took 2 1/2 weeks before it showed up on ULS. It will show right under your GMRS when it does. I am sure it will show up some time next week. Look for it in the afternoon on the web site. Because allot of people I know as well as when Mine went through I had checked it in the am. By then I was checking 2x a day and it showed up after 2pm CST which is 3pm Est. It will be there you are still early for the government. It should be there some time next week by the way they have been running lately and with Monday being a holiday.

Are you sure your USB to serial cable is working ok? Those are not just a cable, but a circuit inside translates the USB to serial. That circuit usually has either a Prolific chip, counterfeit prolific chip, or FTDI chip.
It's pretty common to have a problem with the software driver that makes the cable work, especially if you have a counterfeit Prolific cable. Some people have reported that using an older version of the Prolific driver, or a 3rd party driver has made their "generic" USB to serial cable work.

Guide to programming cables

No... for two reasons.

1. all the "E Plus" signifies is the case the electronics are packaged in.
The electronics is all the same for all UV-5R{whatever} radios
2. the driver that is require is based solely on the USB-to-serial chip in
the programming cable.

You can if they are analog FM.

> I am studying for my test here in the Bay Area and just wanted to
> see how my radio sounds and what's happening in the area. I know
> you can't transmit at all without the appropriate licenses.

You can transmit anywhere from 136 to 174 Mhz and 400 to 520 Mhz
using the UV-5R.

>Question: Do I need to hack this radio? What do I need to upgrade,
>patch etc. on this guy?

No hacks or patches needed.

>Any help for a noob would be appreciated, I don't want to do

Good recommendations on the CHIRP software that is downloadable free on the Internet. There have also been posts that indicate the programming cable may not fit easily into the HT, and may need some "persuasion" to fit properly.

Good luck, it will work eventually.

JAMES,

MAY BE THE VOLTAGE IS TO HIGH, FROM WHAT I HAVE SEEN USING THE AAA BATTERY CASE
AND I DO BELIEVE IT HAS BEEN MENTIONED HERE BEFORE.
WHEN THE ENGINE IS OFF, ALTERNATOR DOES NOT RUN, BATTERY VOLTAGE AT BATTERY IS PRESENT.
WHEN ENGINE IS ON, VOLTAGE GOES UP. CHECK BOTH WAYS WITH VOM.

ZIPPY,

It's not just during starting, it (the radio) shows it it working properly but no Tax or Rx is happening. It only works without the engine running

Probably some noise desensing your radio when the car is running.
Could be anything, computer, ignition noise, fuel pump....

33609. AA Battery Pack

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-07 22:31:22 UTC
From: Paul Nourse
Topic: 33609 Message: 33609

Is it really true the UV5R is not tolerant of the 7.2 to 9V from the AA battery pack? I'm not sure if a cheap DC to DC converter small enough to fit inside the battery pack would have enough current. As far as the AAA pack there is almost no room for anything except a few diodes and some sort of switch.

Anyone tried anything like that?

The OEM charging cradle does that when ran directly off of the accessory outlet in the car.

That shouldn't make any difference with a battery eliminator unless the regulator in the battery eliminator isn't doing its job. So it is definitely worth checking, because if the output voltage is going much above 7.4 volts when the engine is running, the radio will do as you say. If that is the case, the battery eliminator should be repaired or replaced.

Jim KC9HI

Two or three diodes in series would drop the voltage due to there forward voltage drop. Add a bypass switch for the batteries for when they get low. I'm sure some sort of super simple automatic circuit could be devised to do the switching.

From: topossibilities
Topic: 33578 Message: 33614

To enable the scanner, press and hold the '*scan' key for about two seconds.

In Channel (MR) mode it will scan your channels at approximately three frequencies per second, it's not the fastest scanner in the world, but it is nonetheless a useful feature to have at times.

The scanner is configurable to one of three modes of operation: Time, carrier or search.

Use menu #18 to select the desired mode.

In Time (TO) mode, the scanner stops when it detects a signal, and after a preset time out time, it resumes scanning.

In Carrier CO) mode, the scanner stops when it detects a signal and when the signal goes away it resumes scanning.

In Search SE) mode, the scanner stops when it detects a signal. To resume scanning, you must press and hold the *scan key again.

I have everal of these radios. I programmed them all the same via the supplied software and fixed I found here. On day one worked awesome. Now we are un able to access any repeaters. I reset the radios to factory settings and reloaded the same programming set up. All the settings worked once.....any one else have this problem?
I am certain I did some thing wrong...ALL the tones are triple checked. Off sets as well. are there any other settings I am over looking?

I started out using a piece of a wood dowel, two brass thumbtacks
(one stuck in each end of the dowel) and a piece of wire soldered to
the two thumbtacks. Then I found a piece of brass rod that was the
same diameter as the AA cell and cut a piece the same length.

33618. Cost of UV-5R in China ?

I'm curious if anyone knows about how much a UV-5R radio would cost in China? I've seen them as low as 31USD here so I am assuming they are less in China? Thanks.

Dave,

Which programming software did you use? Would you attach or email a copy of
the saved file so I could take a look at it?

Hi guys,

Is is odd to receive a UV-5RAX+ when you ordered a UV-5R? Should I care much as a novice user?

From: renaissance.man.universalis@...

Most of the other handhelds have a DC power jack, but the Baofeng doesn't. Has anyone figured out a way to jerry-rig the UV-5R to be powered externally, without a battery?

Just took delivery of a couple more UV-5Rs (makes about 30 so far). One of them has no audio on TX but does have audio if I use a speaker/mic. I am guessing this is a fault justifying return to 409shop but before I do has anyone else experienced this? And found a solution?

If you just got it, I'd call your vendor and get them to issue a call tag
for the unit to be picked up and a replacement shipped (hopefully one they
actually test this time).

I don't really understand all the interest or need of AA or AAA packs. Would there ever be a circumstance where you could buy AA cells but not charge the lithium battery?

The standard 1800 mah battery lasts a few days of normal use. The larger 3600 or 3800 mah batteries can go 3-5 days of use, perhaps more if you just listen a lot and don't talk unless absolutely necessary.

And charged lithium battery packs will hold the charge quite well for weeks.

My battery eliminator, the gadget with the cigarette lighter plug, works just fine.

So I just don't see ever needing to use AAs or AAAs. Just wondering.

I finally got the Windows self extracting (.exe) version of the Chirp LiveCD updated on the website. Both the .iso and the .exe versions contain the 27 August Chirp-daily.

If you are using this as a LiveUSB and have updated Chirp with the Chirp Updater script, there is no need to download this version. In fact, you probably have a newer Chirp-daily.

i use a lot of aa and aaa batteries, buy them by the 100, for remote controls, optical mouse, flashlights,
and on and on. we have been without the grid for days and days at a time. when we lose the grid
here in north central pa, everything can go down, even gas stations. the local repeater is on the county
tower/power but the lp gas runs out too. a 4-5 watt ht can get to other hams as many of us live on or
near the top of a mountain. the shelf life of rechargables is much shorter than aa/aaa, in fact i have
used them when they are 10 years past their date. they don't last that long but there is still life in them. granted, when they are done, they are done.
the aaa cases i just received are the only ones i could find at the time, 3 old crows is out of stock on
aa cases.

Then clearly you have neither interest in nor experience with emergency communications.

> Would there ever be a circumstance where you could
> buy AA cells but not charge the lithium battery?

Apparently you live somewhere that the power has never gone out and have never heard of places like New Orleans (and the entire gulf coast) or New York & New Jersey which have been hit by hurricanes or anywhere in the Midwest that has been hit by ice storms.

> The standard 1800 mah battery lasts a few days of normal use.

THAT is a brand new battery pack -- under very light "normal" use consisting of mostly "listening" with no received signal, perhaps a 5-5-90 duty cycle.

Try a one year old battery pack and a conservative 5-20-75 duty cycle -- you might last half a day.

> The larger 3600 or 3800 mah batteries can go 3-5 days of use,
> perhaps more if you just listen a lot and don't talk unless absolutely
> necessary.

Again, cut those numbers in half with a not-so-new battery pack and a more active duty cycle.

> And charged lithium battery packs will hold the charge quite well for
> weeks.

Compared to batteries that hold their charge for years -- and can usually be replaced without the absolute need for outside power sources.

> My battery eliminator, the gadget with the cigarette
> lighter plug, works just fine.

It sure does -- as long as the power stays on so that you can keep refueling your car to waste gasoline powering a handheld radio.

> So I just don't see ever needing to use AAs or AAAs. Just wondering.

YOU don't ever need one. Some of us on the other hand have experience and prefer to be prepared

I think all need take a leaf out of my book. I have a big truck battery that is charged with a solar pannel and also a small vertical wind turbine. I use both with been in the north east of the UK we do not get that much sun. But I will be adding a new bigger amp battery soon, as I have been making too much power for the one battery. I hate the thought of having to dump the excess power. But even if I had a full power out, then also have an invertor for 240V. This will run the pump and boiler, as what good is central heating if you have no power to run the pump.
But I use just about all of my radio equipment off the 12V battery. No mains hum or any power surge, think that more need to look forward and have a bit of backup power.
Well that is my rant over.

Bye from John in the UK

Actually, I do. I suppose you missed my report of actually using the UV-5Rs during Hurricane Isaac last year. And I am appreciative of the flashlight feature, too. ;-)

I live about 90 miles west of New Orleans, and have been there, done that, got the T-shirt as far as hurricanes. I have multiple ways of recharging, quite a bit of gel cell battery storage on 24/7 maintenance charge, a 7 kw generator, and on and on. We are presently adding a natural gas / propane conversion to our club generator, and I'm presently putting together some solar charging capability at home.

I'm well versed in the operation and charge characteristics of alkalines, NiCads, NiMH, and just don't see alkalines as being a reliable way to operate a radio.

We do lay in a good supply of AA and D batteries each spring, well before "hurricane season". I use them for other things, not radio gear.

You find your batteries discharged, your power is out, your car is unavailable. A battery pack that can hold alkaline batteries that hold a charge for years just sitting a on a shelf would be very handy to have. Also convenient to use while waiting for your rechargeable batteries to charge. Alkaline batteries don't self discharge like rechargeable batteries. Even an alkaline battery that is past its sell by and shelf life will usually still have a useful charge.

At least that is how I see it. :-)

So what you are saying is you have one way of doing things or maybe many ways of doing things so you see no need for another good way of doing things. It that about it? I'm sure I can rig up a solar charger or even use an old bicycle generator on my old school 10 speed, but why would I want to limit the possibilities! I like the quick convince of alkaline batteries yet I am open to all the other ways.

Just my 2¢ worth. :-)

Hello,

Very good thread on AA batteries for the UV-5R guys.

Short bio: I am 46yo, in West Florida. I have an Extra Class Amateur license. Not much into VHF/UHF, but I am developing an interest lately. 98% of my operating is in Morse code, using ultra light portable radios which I build from kits. I also build antennas of all kinds.
My main motivation for getting into radio was and still is prepping.
By the way check out radiopreppers.com, it is a great site.

I just ordered a UV-5R+ and joined this group. I do however use AA batteries for other radios, like my Elecraft K1 and Weber MTR.
AA cells can also be used in my Elecraft KX3. So, AAs can power all my radios. And of course flashlight, toothbrush, beard trimmer, etc. LOL.

(The weber MTR is an HF radio the size of a pack of cigarettes, CW (Morse code only) two full bands (usually 40/20m) 5W output. It works with between 6V and 12V DC input. It is rarely available for purchase (300 ever sold) and only as a surface-mount kit.)

My choice is AA rechargeable cells which I use in a pack of eight.
My Weber MTR has the same issue as the Baofeng, a limit of 12V.
When using alkalines, I have a battery holder with a soldered wire instead of one cell.. I also have power cables with one or two diodes in series to lower voltage (0.6V per diode).
Maybe there is enough space in the Baofeng alkaline holder to fit a small Zener diode?

For recharging, I have a Goal Zero Nomad 7 (7W) solar panel, which can charge four AA cells in about four hours (in Florida..).
Since one pack powers my MTR for a week, I'm fine..

Incidentally, my 8-cell packs can be use to recharge my Yaesu FT-270R's battery. It uses the same DC plug as my MTR!

It is good to have alkalines in reserve for sure. I plan on getting the Baofeng AA holder soon. Why limit oneself to only one kind?
I like to have a couple dozen in reserve, but I might up that number after reading this thread.

Another venue I am exploring is 3S Lipo packs. Charging is a bit tricky, but they are so light. I will make sure I have a cable with a plug that fits the UV-5R+, so I can recharge the 1800mAh battery with a Lipo pack.
I just have to make sure the Lipo isn't drained below 9V or it's toast..

Bottom line is, for emergency radio operations, low current draw is the main factor, unless you want to carry heavy batteries you might not be able to recharge. You might have to carry your station too, and ounces count. So, if you can't power your HF radio or VHF/UHF handheld with a handful of AA batteries, IMHO you have the wrong rig.

Gil.

I keep several sets of NiMh charged. But my main reason was wanting to leave the radio on at bedtime.

If the AAs discharge completely, it's not the same issue as discharging the factory battery.

Subject: [baofeng_uv5r] Re: AA Battery Pack

I don't really understand all the interest or need of AA or AAA packs. Would there ever be a circumstance where you could buy AA cells but not charge the lithium battery?

The standard 1800 mah battery lasts a few days of normal use. The larger 3600 or 3800 mah batteries can go 3-5 days of use, perhaps more if you just listen a lot and don't talk unless absolutely necessary.

And charged lithium battery packs will hold the charge quite well for weeks.

My battery eliminator, the gadget with the cigarette lighter plug, works just fine.

So I just don't see ever needing to use AAs or AAAs. Just wondering.

As long as you realize that there is no charging circuit in the extended battery pack. The side port is in parallel with the charging tabs on the back and would require the same regulated voltage and shut down circuitry as provided by the charging cradle.

As far as I know only TYT has a charger like this (12v DC and 110v mains) but I have never seen them available separately. You would be better to think of this jack as an auxiliary output port to run some other device from instead of a port to charge it.

Depends on if you think the cosmetic difference is worth it, as that's what the difference between the UV-5R and UV-5R+ is.

At least one of the three I received new last week has this problem,
Howard. It is one of those with the offset placement of the audio jacks
I posted about last week. I now need to test the other.

The problem is undoubtedly in the mic jack, with one connection failing
to spring into the contact position with no external mic connected. I'll
probably fix this one rather than return itto Hong Kong.

Due to current draw in my camera alkalines heat up, lose voltage and quit prematurely. As I shoot my AR-15 with Eotech sight the temperature rises, and it quits, too. Both devices function fine with lithium AAs.

And many years of experience flying R/C (about 40+), I would never ever use alkalines for that purpose either.

Sorry, guys, for reliability I'm not convinced that AA alkalines are the way to go and have found other solutions.

In a word ~ NO. I went through this too. Instead of spending the $12 on the Plus, I got a much needed program cable with my UV-5RB. If you want the look of the UV-5R Plus without spending additional money, then buy a UV-5RB. They look identical.

What you want to look for when buying a + is the "quatro" models. They are ur5r's in the old style with a metal face plate and are a bit more rugged tahn the plastic ones. the quatros are a litle bit harder to find because only one exporter is shipping them. Any one that’s selling them that inst sainstore is having sainstore drop ship them for a profit. i get mine at radioodity.com 20 units at a time

I have the UV-5RE Plus. I was not able to find the half-moon seals on my radio. Do we have any pictures?
Love the group, lots of good information with a bit of familey squabling.

It matters when you want to purchase an extended 3800 battery, look at the bottom of the radio and see if you have two half-moon looking seals under the name, or just one seal.

If you have 2 , one inside the other your battery will need to be modified and a std 3800 with a full tray needs massive modification. If you get a no tray or smooth battery only the lip edge needs modified.

You must pay attention to this if you want these accessories.

1: Which models have the Metal case body?
Not just the front plate.
2:Also of them which is the newest?

Please pass along a link where to buy it at the best price.

Thanks,
John

When power goes down gas stations can't pump gas. They also cannot process your credit cards. Your bank is offline anyway, so even if the gas station has a generator, no credit card. People often forget cash as part of their emergency preparations.

There is no internet. Telephone service, if available at all, is often local only. That "all lines are busy" recording really means "all lines out of town are not working."

The gas station, convenience store, grocery store, etc, also cannot take your cash because the cash register does not work without power. Everything that was in the cooler will spoil. Inside of stores is dark and they can't see anything, so the stores simply lock the doors and post hired guards.

Your credit card (or debit card) is useless. Cash is king. When things continue like this for a longer period you fall back on barter. I've actually purchased items I needed with a box of .22LR.

Avoid lines at all costs. I'm talking unprepared people lined up trying to get government help, food, water, etc. Mostly they are people that do not need handouts just trying to get free stuff. Rule of thumb, what everybody else is doing is not for you. Head the other way.

And from experience anyone from the government is NOT there to help you, but there to try to control you, as if you were a prisoner, automatically assumed to be a criminal.

And guys, please don't toss up Katrina, Sandy, etc as examples to me. I've done all this before, more than once. Most notable, Hurricanes Andrew in '92, Katrina and Rita, Gustav and Ike.

Camille when I was a teenager was quite bad. Andrew was a Category 5 and passed directly over.

And when the eye of a hurricane passes over, yes, the sun really does come out and it quits raining. You have about 45 minutes to secure things, get the limbs and leaves out of the storm drains so the street will drain. And then the wind and rain will come from the other direction.

After a hurricane the most important thing is potable water. It is quite hot, the humidity is 110%, and no breeze to speak of. You will sweat buckets. You need to stay hydrated. Food is not the problem, water is. Next is loss of civility. I don't care how good you think your community is, the goblins will come out at night.

73,
Paul - AE5JU

The ebay ones are based upon the well known 7808 linear regulator and some caps (not always properly soldered). So if you can remove the 7808 and put a 7.5-8V DC-DC converter
it will probably stay cooler than that :).

You can also drill holes in there to remove some heat, otherwise holes appear naturally in the plastic against the UV5R.

Yea, you can use any cpu board that you want. The interface are all simple 3.3V logic (i2c, spi, and io).

Lior.

> So, aside from making the radio sending Morse code, after all that work, what have you been able to get the UV-5R+ to do?

I have a wish list on the UV3R of what I want the radio to do.
https://github.com/lelazary/UV3RMod/blob/master/WISHLIST
So far I have RTTY and GMSK (http://groups.yahoo.com/group/baofeng_uv5r/message/19833) working (actually any mode using FSK or PSK see http://www.elazary.com/index.php?option=com_content&view=article&id=50:txrx-digital-data-using-the-uv5r&catid=14:baofeng-uv5r&Itemid=17). I have also used it as a field strength meter to measure antennas and as a hound for fox hunting (you can get a resolution of 1/8dB). For fox hunting I have the signal go into the speaker as a tone, so we can hear when you are facing the fox. I also have it as a fox sending my call sign over Morse every predefined interval. Lastly, I have been working on a Morse trainer for people, so you can send it Morse code, and it would reply automatically.

However, it have been very difficult to implement some of these things on the UV3R due to the memory constrains (only 16K). This is why the UV-5R was a better platform, but you needed to remove the CPU, which was difficult. Once I have the board built, the UV-B5 should be a very easy hack out of the UV-5R and UV-3R.

Lior.

Lior,

I must say, youÃ¢re a friggin stud.

So, aside from making the radio sending Morse code, after all that work, what have you been able to get the UV-5R+ to do?

What would be interesting is to make it somehow interface for SSB modes like RTTY or other data communications, remote control via internet ? Point to point data on 440? Not sure what else would be functionally interesting

What is the hacking group?

Subject: [baofeng_uv5r] Hacking the UVB5

Just wanted to share some information on hacking the UV-B5. I know there is a separate group for that radio, but the original hacking of the UV-5R started here, so I am posting the information here as well (and since the radio are very similar to each other).

Bottom line, is that the UV-B5 is a much simpler hack since they have separated the CPU from the radio with a cable. Also, the programming pads on the CPU are exposed, but I have not been able to program the CPU (maybe I have the wrong protocol).
You can read more on the hacking progress here:
http://www.elazary.com/index.php?option=com_content&view=article&id=53:hacking-the-uv-b5&catid=14:baofeng-uv5r&Itemid=17

33681. RE: [baofeng_uv5r] Versions with metal case

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-09 19:23:04 UTC
From: Dan Z. Johnson
Topic: 33670 Message: 33681

Up until last week, all Baofeng radio cases were machined from a single block of unobtanium.

However, it is my understanding that they have since moved to an all papier mache housing.

No.

Only the Unobtanium-cased radios accept the 95Ah car battery.

The Papier-Mache versions have a hand crank on the side, so no batteries are needed.

Indeed, the newest CHIRP version will not only enable “Sayings of Chairman Barry” but also activates a drone beacon.

And you will be able to pay for the new papier mache version with food stamps, since it is fully digestible.

Subject: Re: [baofeng_uv5r] Versions with metal case

The new Baofeng version CCP Red Star, UV5R+++++

Has a built in voice that quotes Chairman Mao Red Book slogans to listen to while waiting for your local Net check-ins.

You now have the option of selecting English or Chinese for the Quotations, in Chinese mode you will hear a pleasant China-Girl voice.

For some reason the English voice sounds sorta like Obama. I am sure the latest daily build of CHIRP will give us an option to disable this function.

good afternoon im using chirp to program my radios and i have a question about pl codes

i need to have pl codes for two channels the pl i need is 156.7 but chirp only lets me put whole numbers in is there any way to fix this problem

thanks

Look carefully, you might be using the digital code entry which are three digit whole number codes.

Stan

From: Xaun Loc
Topic: 33653 Message: 33692

ALL the “different” models are exactly the same radio inside a different plastic case.

The only exception is the F-11 which is the same physical radio with slightly modified firmware that allows you to disable the VFO/MR button so you can lock the radio into memory channel mode only..

Price differences have nothing to do with the radio itself – the difference in price is based on what each seller thinks they can get people to spend. Some dealers do provide better value by providing better service, but the radios themselves are all the same.

From: renaissance.man.universalis@...

Was wondering if the UV-5R plus is worth the extra $12.

I have to wonder how many ???Plus??? models you have examined from how many vendors.

The simple fact is that every radio in the UV-5R family ships with whatever antenna happens to be available on the packing line at the time that some kid picks up one radio, one battery, one antenna, one headset, one wrist strap, one belt clip, one bag of screws, one manual, ets, and puts them all in the box to get ready to ship.

From: Jesse

A lot of the "plus" models come with the better antenna, depending on the price it's worth it for that alone in my opinion. Out of all the different radios in the series I like the look of the black original uv5r and the black uv5ra the most.

I have same radio and I just would the pl tones as for digits (141.3Hz entered as 1413), does this help any? STEVE (N7KOA/WQNP678)

Thereâ☐☐s actually not a problem. Part of the dropdown is hidden.
Select 156 and you will see the correct code 156.7Hz selected.

> To expand on what Stan said, the DTCS Code and DTCS Rx Code columns correspond to the menu 12 (T-DCS) and menu 10 (R-DCS) and are for digital coded squelch (aka digital PL). The Tone and ToneSql columns correspond to the menu 13 (T-CTCS) and menu 11 (R-CTCS) tone squelch (aka PL).

To expand on what John said, you may have the column width set to narrow. You can set the column with similar to how you would do it in a spreadsheet like Microsoft Excel. Another thing you could do would be to click on a channel row to highlight it. The right-click on it. Then select Edit from the dialog box that pops up. Now you can edit the PL tones from the right-click Edit menu.

Note:
The right-clidk Edit menu is also the way that you access the extra channel settings like BCL (busy channel lockout), PTT ID and PTT ID Code.

Unless you understand how CTCSS works and know why you would want/need to use RX CTCSS, it is best to start out only using TX CTCSS (having no RX CTCSS always works - setting RX CTCSS incorrectly will result in never hearing anything). That would be...

Tone Mode = Tone
Tone = 156.7
ToneSql = 88.5 (or blank of you have "Hide Unused Fields" enabled (highly recommended))

Notes:
When Tone Mode = Tone, the Tone column is used and the ToneSql column is ignored. The CTCSS tone in the Tone column is transmitted and receiver squelch is carrier operated.

When Tone Mode = TSQL, the Tone column is ignored and the ToneSql column is used. The CTCSS tone in the ToneSql column is transmitted and the same tone is required to open the receive squelch.

With the exception that a couple come with the reverse led display, and some come with the better antenna that the UV-B5 has.

What ever the dealer can do to make his shipment better I guess.

I've probably personally examined more than you have seen packed for shipping at the factory in person. I didn't say they all come with the better antenna.

Part of the fun of the UV-5R is getting accessories for it. Probably the most purchased accessory is a third party antenna. If the radio doesn't come with the better UV-B5 antenna (you probably won't find out until you open the box), you can buy one on eBay for under $5. I just got mine last week.

Topic: 33554 Message: 33699

I got one for my UV-B5+ and another one (different battery form factor) to my UV-B5... they BOTH heat up a lot, to the point the radio stops transmitting due to the excessive heat... they are almost useless, you need to keep your TXs very short. RX is fine.

I bought the auxiliary pasta maker for my UV-5R+. Now I can noodle around on 2m.

Some of these messages are really funny. Just ordered a UV-5R+ from Amazon.com. Going to make sure when I have it in my hot little hands, that I sit with the radio and better manual, and go through it all. Got the programming cable and better antenna and an extra battery. Already own a Yaesu VX-7R, but thought this would make a good backup radio. Also checking to see it would Bo good enough to offer to give one to someone if they pass their Tech Class on the first try. Sort of an incentive for studying hard. I'm the President of our local county Amateur Radio Club. A couple Gus have one, but they complain about the manuals. Don't think they have ever looked on here.will have to tell them about it.

I think the plus version could be worth the extra $12, depending on what you want/get from it... Pls see my video: http://www.youtube.com/watch?v=iy3b0NiQVCc I got a better antenna, a nice rubber case, and in my own evaluation, a better looking radio. The only downside I see is that the UV-5R+ does not accept the extended battery without some extra material removal from the battery's surface. The UV-5R accepts the 3800mAh battery with no modification. You might also consider other options such as the UV-B5, UV-B6, or the UV-82. I have another video comparing the UV-B5 to the UV-5R+.

The only issue with he rubber case is you cant see any labels on stuff and it covers the battery charger contacts on the back of the battery making it difficult to charge while the cover is on. i modded mine by removing a little of the part where the battery terminals are. it might be posable to mod it a little more if your inventive. I have a few interesting ideas about what can be done myself. otherwise you will be finding yourself removing it and its a PITA to put on and off

Hello all,

I have a friend who has a UV5 that will not transmit out of band on the UHF side. On VHF it transmits fine up to 173.00 MHZ. On UHF it will only transmit from 438-499.500 MHZ.

Any ideas as to what might be wrong?

Steve W4YJ
The normal UHF RX/TX band limits for a current UV-5R are 400-520 MHz. Older units were set to 400-470 MHz but are easily changed to 400-520 MHz using the Baofeng VIP software or CHIRP.

Are you saying he can tune the VFO from 400-520 MHz but can only transmit from 438-449.500 MHz? That would be highly unusual because as far as I know, there has not been discovered a method for setting the RX and TX band limits to separate values.

So if the VFO RX and TX are limited to 438-449.50 MHz, then this can easily be edited using the Baofeng VIP or CHIRP software. If it is only the TX range that is limited, I would very much be interested in your friend downloading his current radio channels and settings using CHIRP and email the saved image (*.img) file to me for evaluation.

Bonjour,
Sur mon Baofeng reçu il y a quelques jours, après quelques manips et une programmation des canaux, je me retrouve avec les menus 12 et 13 avec l'affichage SEEK et balayage des différentes tonalités, et impossibilité de mettre sur off.
En plus je n'ais plus de balayage des mémoires, seulement du vfo.
Je ne peux pas savoir la référence du firmware, car impossibilité de l'afficher à la mise en marche, et impossible d'importer la configuration avec le programme CHIRP.
Y a t'il quelq'un qui aurait la solution ?

When power goes down gas stations can't pump gas. They also cannot process your credit cards. Your bank is offline anyway, so even if the gas station has a generator, no credit card. People often forget cash as part of their emergency preparations.

There is no internet. Telephone service, if available at all, is often local only. That "all lines are busy" recording really means "all lines out of town are not working."

The gas station, convenience store, grocery store, etc, also cannot take your cash because the cash register does not work without power. Everything that was in the cooler will spoil. Inside of stores is dark and they can't see anything, so the stores simply lock the doors and post hired guards.

Your credit card (or debit card) is useless. Cash is king. When things continue like this for a longer period you fall back on barter. I've actually purchased items I needed with a box of .22LR.

Avoid lines at all costs. I'm talking unprepared people lined up trying to get go

Absolutely a good incentive to pass the licensing exam. I am blind and had absolutely no problem programming my own UV5R myself. I wouldn’t mind having another for that matter. Great radio and can’t beat the price.

Some of these messages are really funny. Just ordered a UV-5R+ from Amazon.com. Going to make sure when I have it in my hot little hands, that I sit with the radio and better manual, and go through it all. Got the programming cable and better antenna and an extra battery. Already own a Yaesu VX-7R, but thought this would make a good backup radio. Also checking to see it would Bo good enough to offer to give one to someone if they pass their Tech Class on the first try. Sort of an incentive for studying hard. I'm the President of our local county Amateur Radio Club. A couple Gus have one, but they complain about the manuals. Don't think they have ever looked on here.will have to tell them about it.

Mark

It is perfectly safe to set your radio to display any bunch of numbers that you enjoy seeing in the display window.

It is also perfectly safe to “transmit” with a ridiculous bunch of numbers displayed because the radio will not actually transmit outside its actual frequency range.

I recommend programming the radio to display your cell phone number then pressing the PTT switch to see if will call your phone. That works at least as well as any 900 MHz frequency on these radios.

John.

I'd have to fire up the other computer that has the programming software on it to be 100% sure, but I believe it's BFB307. The radios (I have two) are actually the BF-F9 version which I purchased from Kurt at Three Old Crows.

I am about to leave run some errands, but will verify the version when I get back home and send you an email.

Hi

Does any one knows how (if at all) to program the Baofeng UV-5R to produce
the 1750 Hz tone burst? (I'm planning a trip to Italy next month)

Thank you

can someone tell me if they have fixed the problem with the cables not plugging into the radios properly on the newr vesion uv5r radios? i have a pre 291 version that is a real pain to get the cable to connect right to where it is seen by my computer (yes i have trimmed the case) i'm thinking of picking up a newer version if they have fixed this issue.

thanks

> Bonjour,

Menus 10, 11, 12 and 13 are "read only" in channel mode (MR). In other words, you can only use them to see what has been programmed into a channel. You can not use them to make changes to the channel when the radio is channel mode (MR).

You can only change the menu 12 and menu 13 settings by reprogramming the channel from the top display in frequency mode (VFO) using menu 27. When you changing the menu 12 or menu 13 settings by reprogramming, be sure to also set the VFO frequency to the same frequency of the target channel or the TX frequency of the channel will be changes to the frequency displayed in the VFO. Another solution is to erase the channel and program it again.

I hope this helps...

If you just started out with a blank spreadsheet to create your CSV file, then you really can't. What you need to do is download from your radio to CHIRP to get a UV-5R compatible template. Then export that template to a CSV file. Then use the exported CSV file to enter your channels. Just don't mess up the format that was output from CHIRP (ie: don't add, remove or change the order of the columns). Also watch out for the excel bug that messes up the rows that end in several commas. You may be better off editing your CSV file with a text editor instead of excel.

I can verify what Jim just stated. One of our members brought in five
UV-5R radios today to be re-programmed for an event we are attending. It
took me three different cables before one of them worked on all five radios.

When the frequency keyed in doesn't match up to the value in STEP (menu 1), the radio always rounds down to the closest allowable value based on your current STEP setting. Your STEP value must be set to 20.0K, 25.0K or 50.0K. Note: STEP settings of 20.0K and 50.0K are not available on firmware version below BFB291.

Like Jardy mentioned, you should set your STEP to 2.5K or 5.0K, and in this case, even a STEP of 10.0K would work.

Topic: 33755 Message: 33760

Go to menu #1 and change the step size to at most 10.0K - I keep mine at 2.5K which is the minimum possible on my firmware.

Any time you enter a frequency it will round down to the nearest step size which is why you're seeing 200 and 600 - you probably are at 25.0K which I believe is the default as shipped.

Yes.

The CFPP5M will be integrated into a destroyer-class, ship-based laser weapons system.

One will simply need to clip the UV-5R to the side of the ship, using the provided attachment point.

Harbor Freight also has an auxiliary power source for the UV-5R radio, but it is gas engine/hydraulically operated and comes with a 30 ton log splitter. The good news is that it includes a tow hitch and highway-rated tires.

The new Baofeng version CCP Red Star, UV5R+++++

Has a built in voice that quotes Chairman Mao Red Book slogans to listen to while waiting for your local Net check-ins.

You now have the option of selecting English or Chinese for the Quotations, in Chinese mode you will hear a pleasant China-Girl voice.

For some reason the English voice sounds sorta like Obama. I am sure the latest daily build of CHIRP will give us an option to disable this function.

Nothing has changed on either the radios or the cables. Some of each are a little better or a little worse. If you happen to have a better cable and a better radio you are golden. If you happen to have a worse cable and a worse radio you are up $#!T creek. For most people with a average radio and and average cable, it is a minor issue.

From: colemantools@...
can someone tell me if they have fixed the problem with the cables not plugging into the radios properly on the newr vesion uv5r radios? i have a pre 291 version that is a real pain to get the cable to connect right to where it is seen by my computer (yes i have trimmed the case) i'm thinking of picking up a newer version if they have fixed this issue.

Arline, KK4KW

__.-
If you just started out with a blank spreadsheet to create your CSV file, then you really can't. What you need to do is download from your radio to CHIRP to get a UV-5R compatible template. Then export that template to a CSV file. Then use the exported CSV file to enter your channels. Just don't mess up the format that was output from CHIRP (ie: don't add, remove or change the order of the columns). Also watch out for the excel bug that messes up the rows that end in several commas. You may be better off editing your CSV file with a text editor instead of excel.

In normal internet communication it is considered lazy and
inconsiderate to use all lower case.
In regard to transmit with the UV-5R it is safe to transmit on
frequencies for which you have
a licence provided you follow the protocols dictated by that licence.

You have menu 1 (STEP) set to 25.0K. That will only only allow your VFO to tune to the nearest 25 KHz. You need to set STEP to 2.5K, 5K or 10K to be able the enter the desired frequency.

The Diamond SRH320A 2m/1.25m/70cm tri-band antenna will work. It has a +4dB gain. It has an SMA male connector so you might need and SMA female to female adapter to work; that is, if your rig has an SMA male terminal like the UV-5R does.

I'm sure most have already thought of this, but maybe it will help someone. Most manuals these days are either microscopic with too much info you can't read quickly, or simply microscopic with garbage. Either way, if you need to make a change on the fly, you have to pull over, get comfortable and fiddle with the manual/radio until done.

Instead, take a source such as miklor.com, copy/paste the bare info for each topic you might need while away, and print in the format you like. I use the Post-card format in MS Word and post-card paper from Office Max. I carry mine in the pocket on the back of the driver's seat. If you hike, fish, hunt, etc., laminate them with clear shelf liner. Design your own instant reference manual. Works for H-T, mobile rig, GPS etc.

So why won't CHIRP work for you? A poll about a year ago in this group showed that the number 1 programming software used for programming the UV-5R was CHIRP. The number 1 OS that was used to run the programming software on was Windows 7.

Have you got the correct driver properly installed for your programming cable. That is the number 1 issue with programming the UV-5R no matter which software or OS you are using.

Visit the Miklor.com website and read the "Drivers and USB Cables" page to get the drive and properly install it.

Hey, what do you want? You bought the cheapest 2m HT available. Have some patience, read the list, do some searching, do some reading.

The USB that came with the radio uses a counterfeit chip. Buy the correct cable from 3 Old Crows and you will be good to go.

Or just go buy the Icon.

And the suggestion of using the CHIRP LiveCD is a good one. It eliminates
the driver problem and will allow you to verify that all of the hardware is
working as it should.

33801. Baoclone: Programming utility for Baofeng radios

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-13 01:47:12 UTC
From: <rock.unroe@...>
Topic: 33801 Message: 33801

I just came across this while getting caught up on reading Han's blog.
http://hamgear.wordpress.com/ (highly recommended)

Baoclone is a utility for programming Baofeng radios via a serial or USB programming cable.
Supported radios:
- Baofeng UV-5R family (http://uv5r.net/)
- Baofeng UV-B5, UV-B6
(http://hamgear.wordpress.com/2012/12/18/review-baofeng-uv-b5-baofeng-uv-b6/)
- Baofeng BF-666S, BF-777S, BF-888S (http://hamgear.wordpress.com/2012/08/11/review-baofeng-bf-666s-bf-777s-bf-888s-and-look-alikes/)
Works with Windows, Linux and Mac OS X.

https://code.google.com/p/baoclone/

Check it out.

Thank you for finding this; now, if I can just find my programming cable, I will be able to program a few frequencies into my BF-666S.

33804. APRS News

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-13 03:01:47 UTC
From: Colorado Rob
Topic: 33804 Message: 33804

Hi Everyone,

Folks that have followed along with my APRS adventures building a TNC know
that they started here on this Baofeng UV-5R group. The first prototypes
using an Arduino and a breadboard are documented in the APRS photos
section<http://groups.yahoo.com/group/baofeng_uv5r/photos/album/890131112/pic/list>.
What started out with a Bluetooth board, an Arduino, a UV-5R and an Android
phone is now a real product.

If anyone wants to play along with APRS on the UV-5R, you can find them
here: http://www.mobilinkd.com/.

This is a battery-powered, Bluetooth TNC that connects to the radio. The
TNC talks to APRSdroid<https://play.google.com/store/apps/details?id=org.aprsdroid.app>on
Android (or Xastir on Linux, or APRSIS32 on Windows) via Bluetooth.
The
UV-5R with the 3800mAh battery is the perfect companion* as they will both
last about 48 hours on a full charge. It is a KISS TNC that is designed
for APRS. It is designed for use with HT's, but I have one running on a
mobile rig as a local digipeater too.

* Those that know me also know that I live in an area where the UV-5R does
not perform well on VHF. I have to drive a good ways away from the city
before I can hear much on VHF. But if you don't have these problems in
your area, you should find that the UV-5R works well for APRS. Also, some
digipeaters have rather short TX Delay (the time between when it starts
sending the carrier and starts sending data). The UV-5R is rather slow to
open its squelch and can miss these packets.

The Baofeng is by no means a perfect radio for APRS -- but for under $50,
it's a great radio to get started with APRS. And we've managed to keep the
price of the TNC under $50 as well. If APRS is something you have always
wanted to play around with, this TNC
<http://mobilinkd.myshopify.com/products/bluetooth-kiss-tnc>is the perfect
accessory for your radio. The TNC is very small and easily attaches to any
HT with a rubber band or velcro strips.

This weekend only -- for members of this list -- enter coupon code UV5R and
get $5 off the UV-5R
cable<http://mobilinkd.myshopify.com/products/kenwood-wouxun-baofeng-tnc-cable>
.

And, if you are interested in hacking the TNC, the firmware and the
configuration program (written in Python; works on Linux and Windows) are
open source and hosted on Github. These and the Android app (which will be
on Github soon) are a work in progress but are functional for getting the
volume properly adjusted.

I'm happy to answer any questions (probably best off-list unless they are of general interest to UV-5R owners). There is a Yahoo group<http://groups.yahoo.com/group/mobilinkd/>set up for this TNC if you'd like to discuss the TNC with others.

Cheers!

Rob

You may have problems because of the small buffers. I've not tried it.
The MCU has very little RAM; the buffers are sized to hold a UI frame, but
not bigger. For IP, the MTU will have to be rather small. And the UV-5R
would not be the radio of choice for that application either. The duty
cycle is typically too high.

That said, I'd love to see people experimenting with this sort of stuff.

33809. Re: [baofeng_uv5r] Frequency

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-13 04:26:19 UTC
From: ZIP-G
Topic: 3682 Message: 33809

Hello All,

Last Week I Received 2 Uv-5r's, Include Chargers, Earphone And Ant. 2 Speaker Mikes, And 2 Usb
Cables/program Disc And 2 1800 Batteries Were Separate But Part Of A Package, Cost Of @ $120.

Attached 1 Usb Cable To Pc (Win Xp, Sp3), Win Xp Detected And Installed Driver To Com 12. Stated Driver
Was Working. Installed Boafeng Software. This Computer Also Had A Prolific Usb For A Bearcat
Bct15x Scammer (Sic).

Next Step, Connect Radio' Turn On And Then Open Software.

Read From Radio And Then Program. One Or Two Freqs And Upload To Radio. All Worked.

Next Step, Open Chirp, Set Up And Download Radio To Boafeng Tab. Open Wouxun Tab. Copy Wouxun Freqs
And Paste To Boafeng Tab. Upload To Radio. All Worked.

To This Point Both Radios Are Working As Expected, No Problems.

Next Step, Top Off All Batteries Then Use Radios Until Battery Goes Down So They Can Be Recharged
Per The Instructions.. Here Things Start To Go Awry. One Battery Charger Just Blinks, Both The Wall Wart
And The Charger Itself. 2nd Charger Is Working Properly.
One Of The Speaker Mikes Works. The 2nd Speaker Mike Is Intermittent, It Works In The Other Boafeng And The Wouxun.. Played Around With It And Found That The Cord At The Plug End Is Apparently
Broken As It Ceases To Operate When Moved.
The Other Mike Works As Expected.

After Charging 1 Or 2 Batteries The 2nd Charger Fails. Radio Ceased To
Function When Voltage Was About 6.2 V. (This Is Good As It Will Keep From Totaling Discharging The Battery)
Fresh Battery Works. Up And Talking Again.

And Now The Rest Of The Story: Items Were Purchased From Amazon.Com. They Were Contacted And Will
Replace Chargers (Entire Box) But Only A Refund For The Speaker Mike.

I Had Also Purchased 3 Nagoya Na771 Antennas. I Prefer The Comet Sma-24j But I Have Broken One Of
Them And Bent The Other At A 45 Deg Angle When I Dropped It And It Hit Right At The Base Of The

Antenna. I Like The Flex Of The Comet But I Am Too Rough On Hts. Thus, The Cheaper The Better, For Me.
Have Only Used One But It Seems To Function As Expected.

Any One Have A Good Idea On A Dc To Dc (13.8 To 7.8 Nominal) Converter? I Guess A Simple Voltage Divider Would Work But I Am Sure There Are Caveats With The Lith Ion Batteries. This Would Use The Defunct Ac/dc Converter Base. Never Did Like The Idea Of A Switching Power Supply.

The Replacements Arrived A Few Days Later And The Chargers Were Swapped Out, No Sense Sending Back A Perfectly Working Radio And It's Already Programmed.

Purchased Some Aaa Battery Cases, 6 Fresh Alk 1.6v = 9.6v And Won't Let The Radio Play. Played With Some Slightly Used Batteries To Keep The Voltage Under 9.
The Voltage On The Lith Ion Is 8.4v With A Full Charge.

I Did Not Have Any Problem With Usb Cable Or Program Installation.

I Read The Instruction From The Advanced Manual (Thanks Jim) And When Something Failed, I Read It Again. The Manual That Came With The Radio Was Somewhat Better Than The One For The Wouxun Kg-Uv6d V2.

ZIPPY,

when all else fails, read the instructions. www.miklor.com/uv5r/UserGuide

Hi,

For general ax25 you might find the tt4 suites your needs better.

This was designed for APRS with HTs -- to get rid of the power cable, the
GPS cable and the serial/USB cable that make interfacing a TNC to a HT a
real hassle, and to give the user a rich user interface available on modern
smart phone.

Cheers,

Rob

Search is right at the top of the page…not very intuitive that it is for your current group like the old search box was. And they say “change is good”….not always…

And, of course, the problem for many is what to search for.

If you guys don’t want to answer the basic questions that could be found in the manuals, that’s fine. But, by some of you being so abrupt and sarcastic, potential users and ham operators are being turned off. Get more people involved and the number of messages an individual person asks goes way down. The nasty attitude seems to be getting out of hand. Could we get back to being a positive group instead of a group whining about people asking questions?

Also there is a menu shortcut list in the links section that list all menu items by their prospective number and their function.I printed this out and keep it with my frequency list,Chirp will export your radio frequencies into a .csv file that you can print from excell with all the channel info.

Subject: [baofeng_uv5r] FW: Re: Another Manual Idea

I’m sure most have already thought of this, but maybe it will help someone. Most manuals these days are either microscopic with too much info you can’t read quickly, or simply microscopic with garbage. Either way, if you need to make a change on the fly, you have to pull over, get comfortable and fiddle with the manual/radio until done.

Instead, take a source such as miklor.com, copy/paste the bare info for each topic you might need while away, and print in the format you like. I use the Post-card format in MS Word and post-card paper from Office Max. I carry mine in the pocket on the back of the driver’s seat. If you hike, fish, hunt, etc., laminate them with clear shelf liner. Design your own instant reference manual. Works for H-T, mobile rig, GPS etc.

You know, that is the kind of reply that makes me just want to laugh.

This guy gets one smart-assed comment from one person, and few pointed comments suggesting that he be a little less lazy, and he gets all indignant and runs off with his toys.

Frankly, Jan, nobody gives a rat’s posterior if you ever ask another question. In fact, a lot of people here are fed up with the lazy newbie questions, BUT this group has some of the most patient and helpful people that you’ll ever find IF you do your homework ahead of time.

Your question about the USB cable not working (Hint: Counterfeit Prolific chip) has been answered several times in the past week. Read and learn.

Remember that I have the connectors on straight through, so if you want to sniff the current communications (by plugging in both sides) you would need to expose the same side of the ribbon cable , since they are reversed (I used an knife to expose the pads). If you just want to hook it up to an arduino, then don't worry about it.

Lior.

I just got my radio a couple days ago, with the ext. Speaker/mic, better antenna, programming cable and extra battery. It took me a little while yesterday evening to download the correct drivers and CHIRP Daily Update with the most recent info; but I got it. You just have to go over the information on the Miklor web site and do some serious reading. Now this weekend I will have the fun of programming my radio.

  Gary, I was addressing the statement that there was no longer a "search" function on the Yahoo! Group page.
I was not addressing the use of a Blackberry.
Please read more carefully.

33848. How to search this groups message archives

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-13 16:36:13 UTC
From: Larry Young
Topic: 33848 Message: 33848

Yahoo has recently changed the appearance of the message format, but the search feature is still active albeit a little difficult to find. I found it this way.
1.Scroll to the bottom of a message page until you see several reflector links.
2. find one that says "visit your group".
3. Selecting this link should open another page with a search window, and entering a subject into this window should reveal all messages on that subject.
I hope this Helps.
Larry K4LXV

33849. RE: [baofeng_uv5r] cannot connect radio

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-13 16:45:56 UTC
From: Dan Z. Johnson
Topic: 33818 Message: 33849

Yes, that is true.
But it only means that the user has chosen to be complacent and to not seek out the information that is in the archives.
FWIW, when following the http://groups.yahoo.com/group/baofeng_uv5r/ link using the Safari Browser (iPhone 5), the home page has the ubiquitous magnifying glass search icon smack dab in the top right corner.

From: <kikiz46@...>
Topic: 33818 Message: 33851

Some people want to learn to fish, some want to sit with you while you fish and others want the whole dinner delivered. I asked questions when I first joined but also studied past answers. Since I am a newbie with very little electrical knowledge, I called Kurt at Three Old Crows and ordered. Used Miklor and You Tube and I am on the air. Lori KD0QWE BTW, when I get tired of answering the same question over and over, cut and paste.

No. Obviously you did not read my response. Jan wants/needs to program using software. I cannot do that with software. Software is not readable by the visually impaired with our computer screen readers. That is why we have to program manually or let a sighted person do it. If Jan wishes to go the manual programming route, I will try to help but I am concerned of what state his radio may be in after this botched programming and choose to not complicate the issue. I'm new too. But, I do know that the negative attitudes are getting to be offensive and will discourage asking for help. Would I ask a question now? Probably not because you'd tell me to go read the manual too! Try listening to a book to find the answer to one question which might be on the last page. Lighten up guys. This ain't rocket science to you but to some it is.

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] cannot connect radio

If you guys don't want to answer the basic questions that could be found in the manuals, that's fine. But, by some of you being so abrupt and sarcastic, potential users and ham operators are being turned off. Get more people involved and the number of messages an individual person asks goes way down. The nasty attitude seems to be getting out of hand. Could we get back to being a positive group instead of a group whining about people asking questions?

Subject: Re: [baofeng_uv5r] cannot connect radio

Until recently, people had no excuse for not reading the Miklor website and not checking the message archives -- now they still have no excuse for not reading the Miklor website but they do have a good excuse for not checking

the archives since Yahoo seems to have eliminated the message search function (either eliminated it or hid it somewhere in that awful trash "neo" look)

From: Jardy Dawson

I don't think people will read that. Nobody checks the bottom of the messages that has the info. No one checks the archives, as they keep asking the same questions that have already been asked 17 times.

I don't mind helping people if I can, but it would be nice if they would do a little research first.
PLEASE read the home page and check previous messages before asking a question!! With a busy group like this, chances are it is already there!

Gary,

That is exactly right. I have never been to the group's home page and won't because Yahoo does not play nicely with my required software. I read all the messages in my Inbox and never see this search box or conversations. If you really want to get confused, get involved in "conversations" with a screen reader (big smile).

33854. Need non-Chirp programing software for UV-5RE Plus

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-13 20:10:18 UTC
From: <m16@...>
Topic: 33854 Message: 33854

I just bought a UV-5RE Plus. It only came with the USB drivers, which I successfully installed (bu using the install program on the disk, NOT the instructions given in the pdf file on the disk, which I tried and did not work). I saw a youtube video where some people had used Chirp with their Baofeng and bricked it, but no programming software came with my unit. The firmware comes up as BFB297. Is there factory programming software that will work with this, or something other than Chirp? It would be nice if I could clone my Yaesu with the same freqs once I get the Baofeng set up. I haven't been able to locate any web info on the "UV-5RE Plus", only earlier versions like UV-5R. Help would be appreciated.

When you are looking for information, if it has uv-5r in it and it is a 2 meter 440 radio, that material will apply. It seems those letters after the r are mostly cosmetic differences. The only exception I know of is the UV5RAX and RCX but they have 220 instead of 440.

Which driver for the programming cable do you have installed?
Which software are you using?
Have you taken a look at the "Drivers and USB Cables" page on the
Miklor.com website?

If you look at the bottom of each email, there are several references for FAQs, hints, user manuals, and cable drivers. Somebody went through a lot of trouble to save everybody time on these subjects. When I joined this group, I had the same problems-no receive audio, original software didn't work, how to program manually, owner's manual suck, etc. all answered at the bottom of the email. Didn't even have to go to the group homepage"

Try using CHIRp as administrator and see if that works for you.

Okay guys, I'm waiting for my new Baofeng Extended battery upgraded version of these radio, I should have it sometime next week. I didn't get the programming cable or the software at the time, but, since I do most of my radio programming by hand it gets my brain moving into useful ways of keeping my fingers busy.

Does anyone have the upgraded version? If so, how do you like and how well does it work?

73's,

Jeff - KE7OUR

This is my opinion.

Rather than the much larger sized battery that almost doubles the size of the UV5R, not to mention the extra weight, I'd just purchase a second standard battery. Keep both charged will give one about the same capacity as the biggee. I'm not check pricing but one may be able to purchase 2 or 3 extra standard batteries for rhe cos of one of the large, heavy ones.

I have a couple of UV-5R radios and a couple of the 3800 mAH batteries (as well as a few 1800 mAH batteries, two AA cases, and two AAA cases).. Each combination has its uses. The 1800 mAH battery will normally last a full day to typical usage; but I tend to mount the 3800 mAH battery for events or occasions when I expect more than normal use.

Considering the price and the necessary corner-cutting required to make that price possible, the UV-5R is a really exceptional product. It does not eat batteries as quickly as some of my older ham and commercial HTs (including various Japanese and US major name brands)

Gary, you may wish that everyone concede to your arguments, but life doesn't work like that.

We live in a era when many people have been acclimated to not thinking for themselves. They rely on others for the simplest of tasks, and form opinions as they are led to do.
I'm NOT saying that this is you (or anyone here in particular), but damn, you should learn how to converse. Don't just run away when someone contradicts you!

33866. Where to Find Frequencies to Program UV5R?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-14 00:37:35 UTC
From: <free.usa.shipping@...>
Topic: 33866 Message: 33866

Hello. I have my new UV5R connected to my PC with the CHIRP program running.

Where on the internet can I find frequencies to enter into CHIRP's spreadsheet so I can program my UV5R to my liking?

Apparently this can be done for various purposes and locations. I can figure that out on my own, no problem.

But my problem is where to find frequencies to input into CHIRP. Thank you.

33867. Yahoo search

From: Michael D Earls
Topic: 33867 Message: 33867

Actually, if still may be morphing. When NEO first hit, there was only a ‘Search Groups’ option.

Over those results, were the choices for ‘Conversations’ and ‘Groups’. Conversations only searched that group. Groups searched all Yahoo groups.

Just because it’s different now doesn’t mean it was immediately after the change.

When so many reported the function entirely missing, on 8/30 I played with it until I figured it out.

It’s definitely been updated since then.

Search is right at the top of the page…not very intuitive that it is for your current group like the old search box was. And they say “change is good”….not always…
And, of course, the problem for many is what to search for.

Mike W9MDB

Subject: Re: [baofeng_uv5r] cannot connect radio

Until recently, people had no excuse for not reading the Miklor website and
not checking the message archives -- now they still have no excuse for not
reading the Miklor website but they do have a good excuse for not checking
the archives since Yahoo seems to have eliminated the message search
function (either eliminated it or hid it somewhere in that awful trash "neo"
look)

From: Jardy Dawson

I don't think people will read that. Nobody checks the bottom of the
messages that has the info. No one checks the archives, as they keep asking
the same questions that have already been asked 17 times.

I don't mind helping people if I can, but it would be nice if they would do a little research first.
PLEASE read the home page and check previous messages before asking a question!! With a busy group like this, chances are it is already there!

You know, that is the kind of reply that makes me just want to laugh.
This guy gets one smart-assed comment from one person, and few pointed comments suggesting that he be a little less lazy, and he gets all indignant and runs off with his toys.

Frankly, Jan, nobody gives a rat’s posterior if you ever ask another question. In fact, a lot of people here are fed up with the lazy newbie questions, BUT this group has some of the most patient and helpful people that you’ll ever find IF you do your homework ahead of time.
Your question about the USB cable not working (Hint: Counterfeit Prolific chip) has been answered several times in the past week. Read and learn.

Normally you would start out by putting in the frequencies that your license would permit you to transmit on.

Then you would google scanner frequencies and some up with websites like radioreference.com or cityfreq.com to name a few.

CHIRP's built in "Import from data source" and "Import from stock config" might even find you some frequencies to listen to.

Be sure to set Duplex to "Off" on any channels that you create for which you are not authorized to transmit on. This will inhibit TX on those channels so you won't accidentally key up on the and get yourself into trouble.

Thanks for that input. I had been advised to get the biggy and hadn’t yet. For my purposes, the smaller size is best so I’ll be happier with a couple extra smaller batteries. I didn’t realize it was double the size.

Do a Google search for 2 meter repeaters, your state
for example. I had no clue there are as many around me as there are! And, look at different sites till you find one that you like or makes sense to you. For example, one I looked at just gave the frequency with no offset direction or tone. Not a good site. Another gave me everything I needed for programming. You can do the same if you vacation in a particular location too for example.

Subject: [baofeng_uv5r] Where to Find Frequencies to Program UV5R?

Hello. I have my new UV5R connected to my PC with the CHIRP program running.

Where on the internet can I find frequencies to enter into CHIRP's spreadsheet so I can program my UV5R to my liking?

Apparently this can be done for various purposes and locations. I can figure that out on my own, no problem.

But my problem is where to find frequencies to input into CHIRP. Thank you.

I'm of the opposite opinion. With the small battery, holding the radio in your left hand, for example, you are only gripping the radio with thumb and two fingers. Trying to work PTT or keypad with your thumb is very awkward.

The longer battery give your hand a full grip, working the PTT and keypad is easier as the radio is held firmly in the palm of your hand. Easy to work one-handed.

The balance and feel of the radio is much easier. After using the larger battery, all of my radios are equipped with the large batteries.

Others that have handled my radios with both batteries have chosen to buy theirs with the large battery only. Not one buyer that has handled the radios with both batteries has purchased their radio with the smaller battery.

for hams: here is western pa http://www.wprcinfo.org/
& western ny/southern ontario http://www.wnysorc.org/index.php,
use google to find your state.

here is the national frequency council http://nfcc.us/index.php/nfcc-coordinators you're going to have
to search the page to find what you want. the first links don't work, scroll down the page.

Do a Google search for 2 meter repeaters, your state
for example. I had no clue there are as many around me as there are! And, look at different sites till you find one that you like or makes sense to you. For example, one I looked at just gave the frequency with no offset direction or tone. Not a good site. Another gave me everything I needed for programming. You can do the same if you vacation in a particular location too for example.

Excuse me, but there is NOTHING about programming via software is in the Manual. And the Manual, I'm taking about that junk supplied in the UV-5R box, is best not looked at and discarded immediately.

We know where there is a better manual and have a link to it via the Miklor site.

If people keep asking the same question it is because the information is not present where people can find it.

Simply refer them to the Miklor site. No need to insult.

The point is you just lost a potential group member that may be able to contribute something in the future. I guess you don't get it. He asked a question, lazy ot not, and got trashed. At least he indicated why he won't ask a question again so maybe the attitudes might change rather than just disappear like who knows how many. Why some ask those "easy" questions when they could "look it up"? Maybe they got so frustrated that they are starting from scratch or need some human help. I recently gave my feedback about the most often listed "help" website because I felt it was overly complex for a newbie, especially a frustrated one who really needs an easy explanation, not a chart more complicated one than the one in the manual. Really, if you don't like the newbie question, hit delete.

You know, that is the kind of reply that makes me just want to laugh.

This guy gets one smart-assed comment from one person, and few pointed comments suggesting that he be a little less lazy, and he gets all indignant and runs off with his toys.

Frankly, Jan, nobody gives a rat’s posterior if you ever ask another question. In fact, a lot of people here are fed up with the lazy newbie questions, BUT this group has some of the most patient and helpful people that you’ll ever find IF you do your homework ahead of time.

Your question about the USB cable not working (Hint: Counterfeit Prolific chip) has been answered several times in the past week. Read and learn.

I don't think people will read that. Nobody checks the bottom of the messages that has the info. Noone checks the archives, as they keep asking the same questions that have already been asked 17 times.

I don't mind helping people if I can, but it would be nice if they would do a little research first.

PLEASE read the home page and check previous messages before asking a question!! With a busy group like this, chances are it is already there!

From: Stanley, Peter
Topic: 33866 Message: 33889

There have been some great suggestion on where to find frequencies, but you can let CHIRP do the work for you.

I am pretty new to all of this, but on some post here or on some other form I saw the trick for pulling down stuff from the internet directly using chirp.

This is what I did:
(this assumes you have chirp talking to your radio as the poster seems to have)
(I am sure there are several ways to do this, but I am still learning chirp and this worked for me)
Make sure your computer has a connection to the internet
Start up Chirp
Plug in the USB Cable into the computer and Radio
Radio: Download from Radio
- choose your comm. Port, radio vendor and model
You now have what is programmed in your radio on the screen
Radio: query data source : RepeaterBook
(a pop up will appear)
For me I choose:
State: California
County: Santa Clara County, CA
Band 70 CM (440MHz)
It opens a second tab that says repeater book, in my case with about 97 entries.
You can pick and choose the ones you want to add and just copy and paste them.
Click on for example line 5
440.225000 K6LLC
Edit: Copy (or Control-c)
Then go back to the first tab Baofeng
And pick a line (memory location) and hit Edit: Paste (or control-v)

Boom done, it is in there with PL tones, offsets all the works.

Now push it to the radio:
Radio: Upload to Radio
And in a few seconds you radio is totally programmed.

It also has lots of “Stock Configs” that can be found under the
Radio: import from stock config
Or
File: open stock config
It has nice stuff like GMRS, FRS, Weather, Marine frequencies.

Give it a try and let me know if this helps.

I was using – CHIRP 0.3.1 – just the stable release not the nightly build

-Peter KK6FLZ

I would hope that I could offer tempered, reasoned explanations without being insulting.

If they ask about ammo, you explain how to determine what is correct.

I've seen clerks at sporting goods stores that didn't know the difference between .357 Sig/.357 Magnum or .45ACP/.45 Colt (my favorite).

When it reaches the point that repetitive questions bother you to this extent, perhaps an occasional breather is in order.

There is simply no excuse for the harsh sarcasm being dispensed by some.

Actually, when I signed up for ham related forums, I stopped reading most of the gun related ones. I'm still getting almost 200 emails/day, to at least read. I don't comment often.

On the TexasCHLForum, the same situation exists with new users asking 'dead horse' questions. They are treated decently and usually offered links to previous related threads.

A suggestion was made there to create a sticky with links to all of the tired subjects. The response was:

"As for stickies, we did discuss this among the Moderators when the suggestion was made, but we decided not to use them for the same reason we didn't set up an FAQ. The Moderators' concerns fall into three main areas; 1) discouraging new members from asking questions; 2) outdated stickies requiring updating; and 3) having to decide what post/thread warrant a sticky.

Whether you use stickies or FAQ's, there is a tendency with some members to refer people asking questions to those resources, sometimes politely, sometimes not. We don't want that happening.

I'm not advocating giving any information that you're uncomfortable with if you feel it violates regulations. But there is no reason to denigrate someone for asking a question.

Subject: Re: [baofeng_uv5r] RE: cannot connect radio

Let me ask you a question, Michael....

What would be the reaction to a new user joining any of the firearms forums you belong to if that new user's first question posted to the forum were something like:

- What is the best way to shorten the barrel of my shotgun to nine inches so it will better fit under my coat?
or
- I have a rifle and a pistol, I don't know what caliber either one is, what ammo can I buy that I can use in both guns?
or
- How do I convert my AK-47 to fire full auto?
or
- The book that came with my new gun is full of stupid stuff so I threw it away. Now I am having a problem loading my gun. What do I need to do?

Keep in mind that in most states, there is NO requirement for a person to know anything about firearms just to own one – compared to this radio which requires a license to operate it and (al least for most people) the only way to get a suitable license is by passing a test that is supposed to include both technical and regulatory knowledge. In any forum intended to provide help for newcomers to any hobby there is only a certain degree of ignorance that is considered reasonable, and in most such forums questions about blatantly illegal activities are frowned on.

From: Michael D Earls <mailto:mikeearls@earthlink.net>
I also stopped asking questions. Better to stay ignorant than risk asking a question here.

Not going anywhere, as I still pick up an occasional piece of information by reading.

But the only messages that I have found that needed the 'Delete' key have been the sarcastic responses.

Keep it up guys.

Excellent idea. :-). Someone asks a question, you send a fat cut and paste or a piece of the whole. If you are tired of answering the same questions then stop answering them! No one is making you answer anything. Another Ham brother will pick up the slack. Or sister. :-)

Sometimes people just want to start playing with their new toy right away. Digging through posts or reading the f-ing manual may be too much to bare. So what. Really. Oh they are lazy, OK. What's your point other than they are not you? Different strokes for different folks. And like I said you do not have to answer anything. You can even skip messages.

Wow its the information age. Who knew! ;-) lol

They actually do make a uv5ra extended battery now they are on eBay. No modification needed any more. Now if u want the one with the charging plug on it then those still have to be modified.

>
> For those that are thinking about buying a Uv5R a fellow member of my club will do the programming for you The radios cost $49 which includes an antenna upgrade and better manuals on CD. The radios are all UV5R' s BFBs311 the latest or UV5RA+ BFB307
>
> The program setup fee is $10 so total is around $59 without shipping.
>
> Those that are having a problem or want a radio might consider doing this. While this is not the $30 price you see on Amazon, at least it will work out of the box and is the latest version. Ext Batteries are already modified for the UV5RA+ if you want the 3800ma version ($20) no fitting or watching youtube videos to figure out how to dremel it.

>
>
>No. Obviously you did not read my response. Jan wants/needs to program using software. I cannot do that with software. Software is not readable by the visually impaired with our computer screen readers. That is why we have to program manually or let a sighted person do it. If Jan wishes to go the manual programming route, I will try to help but I am concerned of what state his radio may be in after this botched programming and choose to not complicate the issue. I'm new too. But, I do know that the negative attitudes are getting to be offensive and will discourage asking for help. Would I ask a question now? Probably not because you'd tell me to go read the manual too! Try listening to a book to find the answer to one question which might be on the last page. Lighten up guys. This ain't rocket science to you but to some it is.

>If you guys don’t want to answer the basic questions that could be found in the manuals, that’s fine. But, by some of you being so abrupt and sarcastic, potential users and ham operators are being turned off. Get more people involved and the number of messages an individual person asks goes way down. The nasty attitude seems to be getting out of hand. Could we get back to being a positive group instead of a group whining about people asking questions?

The point is you just lost a potential group member that may be able to contribute something in the future. I guess you don't get it. He asked a question, lazy ot not, and got trashed. At least he indicated why he won't ask a question again so maybe the attitudes might change rather than just disappear like who knows how many. Why some ask those "easy" questions when they could "look it up"? Maybe they got so frustrated that they are starting from scratch or need some human help. I recently gave my feedback about the most often listed "help" website because I felt it was overly complex for a newbie, especially a frustrated one who really needs an easy explanation, not a chart more complicated one than the one in the manual. Really, if you don't like the newbie question, hit delete.

If you don't know what/how to use it as administrator just ask. I'm an IT Network Specialist so everything computer is child's play. However at one time I was just as clueless, just as helpless. Plus not everyone wants to be that intimate with a computer. :-)

FYI computers or the Baofeng are not that hard. Just take everything one step at a time.

It seems that most of the ones continuing to say things about this are the ones guilty of it to begin with. All we are asking to to do just a little research first, then ask the question. When the question was just answered in depth yesterday, I don't want to answer it again today when the info is so readily available. But, I guess you are right. I will let YOU answer the same question 6 times a week.

I have a Yaesu FT-209 in a Motorola D ring case. Like the cops use, or used to use. Anyway I used to think the FT-209 was small. :-) I like the bigger extended battery. It makes it feel like a radio. :-) Yet I like it with the standard battery stuffed in a shirt pocket.

Topic: 33818 Message: 33900

Let me ask you a question, Michael....

What would be the reaction to a new user joining any of the firearms forums you belong to if that new user's first question posted to the forum were something like:

- What is the best way to shorten the barrel of my shotgun to nine inches so it will better fit under my coat?
or
- I have a rifle and a pistol, I don't know what caliber either one is, what ammo can I buy that I can use in both guns?
or
- How do I convert my AK-47 to fire full auto?
or
- The book that came with my new gun is full of stupid stuff so I threw it away. Now I am having a problem loading my gun. What do I need to do?

Keep in mind that in most states, there is NO requirement for a person to know anything about firearms just to own one – compared to this radio which requires a license to operate it and (al least for most people) the only way to get a suitable license is by passing a test that is supposed to include both technical and regulatory knowledge. In any forum intended to provide help for newcomers to any hobby there is only a certain degree of ignorance that is considered reasonable, and in most such forums questions about blatantly illegal activities are frowned on.

From: Michael D Earls
I also stopped asking questions. Better to stay ignorant than risk asking a question here.

Not going anywhere, as I still pick up an occasional piece of information by reading.

But the only messages that I have found that needed the 'Delete' key have been the sarcastic responses.

Keep it up guys.

> If people keep asking the same question it is
> because the information is not present where
> people can find it.

Then apparently the only solution is to arrange to have you personally visit each and every person who purchases one of these radios.

> Simply refer them to the Miklor site.

Gee, why didn't we think of that?!? Maybe we could put a bunch of information on the group home page along with links to the site. Then maybe we could put all the same information in the welcome message which was sent to each person who joins this group. Then maybe we could put the links to the information into each and every message posted in the group.

Oh, wait, WE ALREADY DO ALL THAT -- and have been doing all that for over a year.

> No need to insult.

You are probably right that insulting the illiterate idiots doesn't help them figure out how to use the radio -- because those same illiterate idiots who are too stupid and/or too lazy to read the information we already sent them are probably equally too stupid, lazy, and illiterate to comprehend that the insults are simple facts.

Hi Greg (and others) -

Just a word of caution when using any on-line or published Repeater Listings... Many of the listings are so-called 'paper repeaters' - that is, repeaters that exist only on paper. In some cases, the repeaters were once in operation but have since failed and have never been repaired. In other cases, some hams apply for the frequencies 'just in case' but never actually establish the repeater.

When I was first licensed, I spent many hours listening for repeater stations that never actually existed.

73,
John - AC4JK

The difficulty with doing something like that is that as soon as you do, there are about a dozen people here who have never actually helped anyone themselves but who will immediately attack you for not being kind enough to the illiterate fools.

I don't think people will read that. Nobody checks the bottom of the messages that has the info. Noone checks the archives, as they keep asking the same questions that have already been asked 17 times.

I don't mind helping people if I can, but it would be nice if they would do a little research first.
PLEASE read the home page and check previous messages before asking a question!! With a busy group like this, chances are it is already there!

I agree with you completely. I run a large yahoo group that has to do with a particular two-stroke motorcycle. We focus on that topic but have no topic police. I tell my brothers in smoke they just made (what ever the current number of members is) friends. That the list/group is like a cyber clubhouse, to just pull up a chair and join in the discussions.

We are all friends here so why would we be disrespectful. On the yahoo groups I run we use everything. We make databases and FAQs of info vendors you name it. We ANSWER any and all newbie questions just as friendly as we can. I let any list member create FAQs databases or whatever helpful thing they want on the yahoo group. Sometime many members contribute, like a database for parts or service.

To those few here that get exasperated at newbie questions. Would you be so rude to someone you were sitting across from? ...So treat this list/group the same as you would any face to face clubhouse/meeting place. Not only will the newbies enjoy the experience but you will to. You'll find your making many new friends. :-)

Just 2¢ from an RF brother & soon to be Hamster

Leave 'em in your Smoke
Smoking Paul

33910. Re: [baofeng_uv5r] cannot connect radio

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-14 15:47:51 UTC
From: KF5ULI
Topic: 33818 Message: 33910

That search bar you mention is no longer apart of the NEW YAHOO group looking crud they call a group now. We have lost everything in the groups I have. photos, links, database, files we cant find them anywhere. We are really thinking of moving our group to the new Google groups.

I know that is what I was saying yahoo has either moved them to a place we
can yet find them or they got rid of them altogether.

I'm waiting to see how it all works out. I hate the new format too. I hope its just a transition thing as they take out the old and bring in the new. It seems to be changing from day to day so I'll wait til the music stops. I hope in the end its better and not some wet dream of some fresh out of college 20 day wonder trying make a mark on the world. :-]

>The new yahoo groups sux, there is no [\photos, no search bar no way to find the archives or links/data base files section. I hate the way yahoo has laid it out it is not user friendly at all. Several groups I own or manage we lost all of our pictures and we can no longer find all of our files. Many of us has written complaints to yahoo over it. Our links sections in the groups I own is missing also all togather sucky what Yahoo has done. We are moving several groups to the new google groups format.

Topic: 33818 Message: 33913

I will do what I can to help anyone. It is what being a HAM is all about,
Us who have been one for a while helps the new Hams out or want to be hams
out. If we keep attitudes like that then the Hobby will not have an influx
of new Hams as it is there are allot that get turned away by older hams who
all they do is complain on the radios and when a New ham gets on they yell
at them, I know several newbes that have sold or gave away everything they
bought due to this exact thing. If anyone needs help and I can help them
they can feel free to email me at KF5ULI@... and I would be glad to
help out anyone. I also work on Ham radios, Cbs, Laptops and Computers.

Are we all seeing the same thing or different? I get this on Firefox and Chrome, Internet Explorer 8 doesn't have the "Search Conversations" but the "Search Groups" is the same.

And I see all the photos from the photos tab on all 3.

http://groups.yahoo.com/neo/groups/baofeng_uv5r/photos/photostream

Files are under "More/Files" and you do have to sign in to see it or to see the menu entry

http://groups.yahoo.com/neo/groups/baofeng_uv5r/files

That search bar you mention is no longer apart of the NEW YAHOO group looking crud they call a group now. We have lost everything in the groups I have. photos, links, database, files we cant find them anywhere. We are really thinking of moving our group to the new Google groups.

Topic: 33815 Message: 33915

George,

You know what is sad here is that the transaction in general makes Amazon look bad and they actually have no knowledge that the vendor has a supply of poorly made cables being sold all over the map. Same scenario goes for Ebay. It all falls on the shoulders of the vendor in any case. Finally, the best place to buy, as you mentioned, is from Kurt at Three Old Crows.

Yes I made the mistake of ordering one from Amazon. (Programming cable that is). Fortunately Amazon gave me no hassles in returning it. Most likely I will be placing an order today for one from three old crows in Texas. I'd like to thank all the members in the group for helping me in this matter.

Heck I'll even answer it on the seventh day if I'm around. Its what a help list/group is all about. But you knew that already didn't you?

Sorry just messing with you. ;-). My bad. Its because I'm only 26... with 31 years experience. LOL. Lighten up brother, enjoy life, you only go around once and no one makes it out alive. :-)

I dont get any of that and the 20 or so groups I own we lost photos, links, database, and everything in there. Unless they are hiding it or got rid of it we dont know. Heck they keep messing with the dang page and its driving allot of yahoo groups to move to Google groups. Heck even some members we have lost in there shuffle to the new sites. I have even had yahoo groups I have been apart of for over 10-15 years disappear on me one day there were there next day they were gone. POOF. Not everyone is gonna see the same thing as others as they are moving servers and changing things in certain areas and groups as they get to them and as they have a delay in changing for certain areas of the world. Not very user friendly at all. Allot of people I know have emailed and filed complaints to yahoo. We will have to wait and see what yahoo says. I suggest if you also do not like the changes to do the same. Yahoo did not need to fix what was not broken and many have used this format for so long we knew it like the back of our hand and could almost do it with our eyes closed. Now we dont know which end is up. Yahoo should have took the If it Aint Broke Dont Fix it to heart before they did all of this as they are loosing groups because of it.

Yahoo has changed the Groups interface to something called NEO.

Many features have been lost, and some just plain do not work.

It is a nightmare for Group Owners and Moderators also.

Please go to:

http://yahoo.uservoice.com/forums/209451

and add your votes on the dismal new interface.

You can vote 1,2, or 3 votes per topic. And you get 50 votes.

An elmer helps. An elmer should not do everything for the newbie, but shows them how to find the answers. If they try and still don't get it, that is another story. I help people with Yaesus, Wouxuns, Baofengs, and a few other brands. One of the first things I suggest are the user's groups. Check the Files, Links, and Archives. Then come to me and I am more than happy to help.

In my area, we have some very knowledgable people that occasionally need help, just like I do on occasion. We also have some CBers that got lucky on taking a ham test. They refuse to do anything for themselves, expecting the elmers to do everything for them. They keep asking everybody (not just me) the same question over and over. Others will tell them where they can find the answers, but they refuse to try to help themselves. How long do we have to baby soomebody that has had their ham ticket for 6 years, always with the same complaint, but not listening to the several people all telling them the same answer day in and day out?

Spend a few minutes trying to help yourself and I will be happy to spend HOURS on my rare days off to help you, if you need more assistance. None of my responses have been sarcastic, just pointing out facts. The info requested is easy to get to just by following the links provided on EACH email from the group.

>> The point is you just lost a potential group member that may be able to contribute something in the future. I guess you don't get it. He asked a question, lazy ot not, and got trashed. At least he indicated why he won't ask a question again so maybe the attitudes might change rather than just disappear like who knows how many. Why some ask those "easy" questions when they could "look it up"? Maybe they got so frustrated that they are starting from scratch or need some human help. I recently gave my feedback about the most often listed "help" website because I felt it was overly complex for a newbie, especially a frustrated one who really needs an easy explanation, not a chart more complicated one than the one in the manual. Really, if you don't like the newbie question, hit delete.

Topic: 33818 Message: 33925

Awesome Angi! :-). When I was a kid I wanted to get a ham license. I went to a local club and some of the old timers were rude. Turned me off but a few nice guys just like Angi here convinced me otherwise. I had a ton of hobbies and never found the time to master morse code. I didn't want to get the novice class license and not get fast enough to pass the general. Back then I didn't know about the better methods of learning Morse code. Then I discovered cars, motorcycles and girls. :-). 30+ years after marrying the hottest woman I ever met and all our kids grownup i have time. Also with no code requirement I figure its time to jump in. :-). Let's enjoy the hobby and leave the stress behind. :-)

>I will do what I can to help anyone. It is what being a HAM is all about, Us who have been one for a while helps the new Hams out or want to be hams out. If we keep attitudes like that then the Hobby will not have an influx of new Hams as it is there are allot that get turned away by older hams who all they do is complain on the radios and when a New ham gets on they yell at them, I know several newbes that have sold or gave away everything they bought due to this exact thing. If anyone needs help and I can help them they can feel free to email me at KF5ULI@arrl.net and I would be glad to help out anyone. I also work on Ham radios, Cbs, Laptops and Computers.

>No. Obviously you did not read my response. Jan wants/needs to program using software. I cannot do that with software. Software is not readable by the visually impaired with our computer screen readers. That is why we have to program manually or let a sighted person do it. If Jan wishes to go the manual programming route, I will try to help but I am concerned of what state his radio may be in after this botched programming and choose to not complicate the issue. I’m new too. But, I do know that the negative attitudes are getting to be offensive and will discourage asking for help. Would I ask a question now? Probably not because you’d tell me to go read the manual too! Try listening to a book to find the answer to one question which might be on the last page. Lighten up guys. This ain’t rocket science to you but to some it is.

>If you guys don’t want to answer the basic questions that could be found in the manuals, that’s fine. But, by some of you being so abrupt and sarcastic, potential users and ham operators are being turned off. Get more people involved and the number of messages an individual person asks goes way down. The nasty attitude seems to be getting out of hand. Could we get back to being a positive group instead of a group whining about people asking questions?

Of all people, the folks on this list should be aware of the concept of signal to noise. When the same 4 questions get asked constantly, and answered to varying degrees of accuracy over and over and over, it drowns out the discussion that really matters, that being undocumented issues.

I think its partly due to the public schools in many areas not teaching the kids to think. Instead telling them what to think. I'm guessing none of the ones asking those questions over and over is home schooled or went to a good private school. I was lucky I went to a public school back when they actually taught you to think and you actually learned stuff. :-). Just be patient with them. :-)

33929. Re: [baofeng_uv5r] cannot connect radio

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-14 17:07:43 UTC
From: KF5ULI
Topic: 33818 Message: 33929

Here here Paul, There are allot of older generation Hams who believe the worst thing the FCC did was get rid of code, novice etc. They say it has damaged the hobby doing this. I dont agree,,, there are many who do not have the hand eye coordination to be able to do code that can be great Ham radio ops, Or there are some who have learning disabilities and have problems trying to learn code. I will eventually try to do code but at this time I dont feel like it. I am active in 4 clubs, Working Ham fests, Public service events, ARES, RACES, EComm, Elmer, and helping others with there radio tech issues ie:fixing repairing, Cbs fixing and repairing, Laptop and computer fixing and repairing as well as a bunch of others, I hate it when we loose new hams because they got turned off by some of the older hams or even some of the newer hams that did not follow proper radio Ediquite. Or who thinks that they can complain over the radio which turns allot of people off. Its just how some are.

Down on the bottom right hand corner at the bottom of every email is a link
that shows up it starts with
Switch to: Text-Only, Daily Digest *Unsubscribe* Terms of Use* Send us
Feedback
this is where you will need to click on the Unsubscribe link it take you to
a form you will have to fill out. Then there might be a survey to fill out.
This is the only way you can do this. Or go to the group home page or whats
left of it after the messing up of it from Yahoo and click on edit groups
and click on leave group. These are the 2 ways you can leave. Its not like
some of the other group forums where you can send an email that when you
send an unsubscribe message Unfortunately it dont work this way in yahoo
groups.

This does not work you have to click the link at the bottom of every email
that starts with Switch to: Unsubscribe is there click that and it will set
you up to do this. I hope this helps.

Your best bet is to ask a club or another Ham in your area what the best ones are. Like in the ARRL book they have allot of mistakes. ONe they have a tone in and there is no tone and the other got wiped out by a tornado this April and the repeater was found in a farmers field. they have not and will not put it back up although that property goes up for auction on the 28th it has a cell tower on it with monthly payments coming from the lessees and the abandoned Radio tower. I might go to the auction to see who buys the property as I cant afford it and ask them what they plan on doing with the Radio tower as I know of several clubs that would love to put a new repeater up there and lease it from them or actually take and buy the stuff from them.

Topic: 33922 Message: 33933

I like the changes. The old groups interface was stuck in the last decade, trying to maintain compatibility with outdated browsers. Neo makes navigation and searching more intuitive for me. There are some missing features and, tes, from time to time a few things break for short periods of time. They are responding to user feedback and making fixes/enhancements on the fly. But, overall, I like Neo a lot more than the "classic" interface. I still think the interface is bit bloated. I like the simple look and feel of Google groups. But Google provides fewer features than Yahoo so their interface ought to be more sparse.

Reading through the feedback page you link to, Yahoo seem to be responding well to feedback. The vitriol from the users is disappointing to see, but seems to the norm on the internet.

What sux was groups I own or have been apart of for over 10 years have POOF disappeared. All of our files, photos, database are all gone in others. They should have gave us an option on wither or not we wanted to change. And or at least let us know a change was coming first so that we could back up stuff in case they lost it like they have. Some of that information we will NEVER get back.

Rob,

You see it as being stuck in the last decade; I see it as being one of the last sites that was friendly to people with physical disabilites of all sorts, as well as a clean no frills interface that did what I needed with minimal effort. Why did it truly need "upgraded" and why couldn't they have the simple courtesy of asking for testers instead of simply choosing people at random and switch their accounts to use the new interface? Yahoo did the same thing with the update to Yahoo Mail, making it harder for people instead of easier, for many of the same reasons.

I like the changes. The old groups interface was stuck in the last decade, trying to maintain compatibility with outdated browsers. Neo makes navigation and searching more intuitive for me. There are some missing features and, tes, from time to time a few things break for short periods of time. They are responding to user feedback and making fixes/enhancements on the fly. But, overall, I like Neo a lot more than the "classic" interface. I still think the interface is bit bloated. I like the simple look and feel of Google groups. But Google provides fewer features than Yahoo so their interface ought to be more sparse.

Reading through the feedback page you link to, Yahoo seem to be responding well to feedback. The vitriol from the users is disappointing to see, but seems to the norm on the internet.

Any easy to install / use software for UV-5re ? Chrip does not work for me (windows 7). Also computer will not recognize USB cable. So stressed.
Should have got an Icon...

So why won't CHIRP work for you? A poll about a year ago in this group showed that the number 1 programming software used for programming the UV-5R was CHIRP. The number 1 OS that was used to run the programming software on was Windows 7.

Have you got the correct driver properly installed for your programming cable. That is the number 1 issue with programming the UV-5R no matter which software or OS you are using.

Visit the Miklor.com website and read the "Drivers and USB Cables" page to get the drive and properly install it.

For those who have not followed tech news, Yahoo has been circling the drain for quite some time now. They are making some changes in a desperate attempt to stay afloat, but the writing is on the wall.

If you have any data online with Yahoo, (or anywhere else) you should back it up. Online storage really means storage that is outside of your control. It is temporary, at best.

33939. Re: [baofeng_uv5r] RE: cannot connect radio

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-14 18:34:24 UTC
From: Xaun Loc
Topic: 33818 Message: 33939

Well, of course, the format of Yahoo Groups does not provide "Stickies" as such – and my own experience with forums that do use Stickies has been that the very people they are meant for are exactly the people who will refuse to read them.

On the other hand, until very recently it was impossible for anyone to join this group without being personally sent their own copy of the links to all the needed information along with an explanation of that material. And even now each and every email in the group contains yet another link to the User Guide

And you might note, in all honesty, that no matter how repetitive the question a newbie posts, they WILL get a valid answer – and very rarely does any honest question get an actually nasty response. The kind of question that does trigger negative responses are those that go far beyond merely repetitive. The most recent example was the newbie who asked if there was a better manual available anywhere, clearly demonstrating that he had not read the welcome message and that he had not even bothered reading ANY message posted in the group.

Subject: RE: [baofeng_uv5r] RE: cannot connect radio

I would hope that I could offer tempered, reasoned explanations without being insulting.

If they ask about ammo, you explain how to determine what is correct.

I've seen clerks at sporting goods stores that didn't know the difference between .357 Sig/.357 Magnum or .45ACP/.45 Colt (my favorite).

When it reaches the point that repetitive questions bother you to this extent, perhaps an occasional breather is in order.

There is simply no excuse for the harsh sarcasm being dispensed by some.

Actually, when I signed up for ham related forums, I stopped reading most of the gun related ones. I'm still getting almost 200 emails/day, to at least read. I don't comment often.

On the TexasCHLForum, the same situation exists with new users asking 'dead horse' questions. They are treated decently and usually offered links to previous related threads.

A suggestion was made there to create a sticky with links to all of the tired subjects. The response was:

"As for stickies, we did discuss this among the Moderators when the suggestion was made, but we decided not to use them for the same reason we didn't set up an FAQ. The Moderators' concerns fall into three main areas; 1) discouraging new members from asking questions; 2) outdated stickies requiring updating; and 3) having to decide what post/thread warrant a sticky.

Whether you use stickies or FAQ's, there is a tendency with some members to refer people asking questions to those resources, sometimes politely, sometimes not. We don't want that happening.

I’m not advocating giving any information that you’re uncomfortable with if you feel it violates regulations. But there is no reason to denigrate someone for asking a question.

Subject: Re: [baofeng_uv5r] RE: cannot connect radio

Let me ask you a question, Michael....

What would be the reaction to a new user joining any of the firearms forums you belong to if that new user’s first question posted to the forum were something like:

- What is the best way to shorten the barrel of my shotgun to nine inches so it will better fit under my coat?

or

- I have a rifle and a pistol, I don’t know what caliber either one is, what ammo can I buy that I can use in both guns?

or

- How do I convert my AK-47 to fire full auto?

or

- The book that came with my new gun is full of stupid stuff so I threw it away. Now I am having a problem loading my gun. What do I need to do?

Keep in mind that in most states, there is NO requirement for a person to know anything about firearms just to own one – compared to this radio which requires a license to operate it and (al least for most people) the only way to get a suitable license is by passing a test that is supposed to include both technical and regulatory knowledge. In any forum intended to provide help for newcomers to any hobby there is only a certain degree of ignorance that is considered reasonable, and in most such forums questions about blatantly illegal activities are frowned on.

From: Michael D Earls

I also stopped asking questions. Better to stay ignorant than risk asking a question here.

Not going anywhere, as I still pick up an occasional piece of information by reading.

But the only messages that I have found that needed the ‘Delete’ key have been the sarcastic responses.

Keep it up guys.

Actually it is. It isn't were older groups members expect to find it, but it is exactly where Dan said it was.

> We have lost everything in the groups I have. photos, links,
> database, files we cant find them anywhere.

Contrary to this and your earlier rant, photos and files are still there. I don't happen to use Links of Databases in my groups, so the links to those functions are greyed out (just as they always were) but the links are definitely there.

> We are really thinking of moving our
> group to the new Google groups.

Go right ahead. I'm sure some of your users will appreciate the changes. Of course, considering that you thought you lost everything in your group just because Yahoo changed the screen layout, I'm not sure that you will be able to find anything in Google Groups because their structure is totally different.

Yahoo has changed the Groups interface to something called NEO.

Many features have been lost, and some just plain do not work.

It is a nightmare for Group Owners and Moderators also.

Please go to:

http://yahoo.uservoice.com/forums/209451

and add your votes on the dismal new interface.

You can vote 1,2, or 3 votes per topic. And you get 50 votes.

Maybe the old interface worked better for the blind than it did for the sighted. That is certainly possible. I am ill-suited to judge. If that is the case, it certainly deserves attention. Visually I found it an ugly, cluttered mess with an non-intuitive layout. I avoided the web interface as much as possible. But, since starting a couple of groups, it has been difficult to avoid. The new layout was a bit surprising when I first encountered it. After a few days my overall impression has been positive.

Rob,

The new interface is, to me, non-intuitive; and from the general tone of the complaints from those that have pretty much been forced to use it, I'm not the only person that thinks so. All of the functions I generally used were where Yahoo put the partial list of Groups that I am a member of, which means that some of the features that I could get to with one click are now buried in menus, and some features that Group Moderators used quite extensively simply do not exist; for groups that depend on being able to preview moderated users messages, for example, the lack of this feature alone is reason to complain or find another site that allows to do that.

If you want to talk further about this, feel free to email me privately at n8ohu@yahoo.com

Maybe the old interface worked better for the blind than it did for the sighted. That is certainly possible. I am ill-suited to judge. If that is the case, it certainly deserves attention. Visually I found it an ugly, cluttered mess with an non-intuitive layout. I avoided the web interface as much as possible. But, since starting a couple of groups, it has been difficult to avoid. The new layout was a bit surprising when I first encountered it. After a few days my overall impression has been positive.

Sounds great! APRSIS32 works well. It has decent KISS support.

I was a rather disappointed when I discovered that the Bluetooth module would not work with an iPhone. It seems that this was done to make add-ons to the iPhone impossible without paying a tax to Apple. Instead Apple makes product developers buy Apple-specific "MFi" modules. Grrr...

There are inexpensive Android tablets available with GPS and Bluetooth; the Nexus 7 is a beautiful tablet that can be found for under $200. Some of the Chinese Android phones and tablets -- perfectly appropriate with a Baofeng radio -- can be had around the $100 mark. APRSdroid is great now that it has OSM downloadable map support. There is no need to have a mobile or wifi connection. When I have some free time I need to see if I can find some topo maps for back-country hikes.

One of the things I need to start offering is a Bluetooth module for PCs and laptops that don't have built-in BT support. I am still trying to find the right one to sell. I'm mostly a Linux guy. Some of the cheaper BT modules work OK with Windows but did not play nice with Linux. The ones that worked out of the box were quite a bit more expensive. That said, I have an old cheap one plugged in right now that used to crash the computer quickly. Support seems to have improved.

Subject: Re: [baofeng_uv5r] cannot connect radio

I dont get any of that and the 20 or so groups I own we lost photos, links, database, and everything in there. Unless they are hiding it or got rid of it we dont know. Heck they keep messing with the dang page and its driving allot of yahoo groups to move to Google groups. Heck even some members we have lost in there shuffle to the new sites. I have even had yahoo groups I have been apart of for over 10-15 years disappear on me one day there were there next day they were gone. POOF. Not everyone is gonna see the same thing as others as they are moving servers and changing things in certain areas and groups as they get to them and as they have a delay in changing for certain areas of the world. Not very user friendly at all. Allot of people I know have emailed and filed complaints to yahoo. We will have to wait and see what yahoo says. I suggest if you also do not like the changes to do the same. Yahoo did not need to fix what was not broken and many have used this format for so long we knew it like the back of our hand and could almost do it with our eyes closed. Now we dont know which end is up. Yahoo should have took the If it Aint Broke Dont Fix it to heart before they did all of this as they are loosing groups because of it.

John,,

I do agree with you. But, online is a good place to start. If I had to rely on local clubs, I would not have the knowledge I have today. Clubs work for some but not for all of us.

Your best bet is to ask a club or another Ham in your area what the best ones are. Like in the ARRL book they have allot of mistakes. ONe they have a tone in and there is no tone and the other got wiped out by a tornado this April and the repeater was found in a farmers field. they have not and will not put it back up although that property goes up for auction on the 28th it has a cell tower on it with monthly payments coming from the lessees and the abandoned Radio tower. I might go to the auction to see who buys the property as I cant afford it and ask them what they plan on doing with the Radio tower as I know of several clubs that would love to put a new repeater up there and lease it from them or actually take and buy the stuff from them.

On Sat, Sep 14, 2013 at 9:08 AM, John Kintz <asheville307@...> wrote:

Hi Greg (and others) -

Just a word of caution when using any on-line or published Repeater Listings... Many of the listings are so-called 'paper repeaters' - that is, repeaters that exist only on paper. In some cases, the repeaters were once in operation but have since failed and have never been repaired. In other cases, some hams apply for the frequencies 'just in case' but never actually establish the repeater.

When I was first licensed, I spent many hours listening for repeater stations that never actually existed.

From: rjtoegel
Topic: 33870 Message: 33957

Good idea but I tried some of those links like "Don't like the manual......" which led to the original manual and two other links which do not look like a better manual. As difficult as it is, the designer has to think like a newbie when designing those areas.
 BTW, I had the same problems progamming mine when I got it years ago. Luckily a ham had step-by-step video on YouTube which was easy and helpful. Certainly beats a chart.

Subject RE: [baofeng_uv5r] There is a welcome message

That welcome message is inadequate .imagine for a moment that you are a frustrated user who tried the lousy manual .Baofeng software doesn☐t work .you find a group about the radio .and the first you see is ☐if you take the time to read☐ at which point you say ☐I already tried the manual☐ and just email the group.

The welcome message should start off with the top 3 or 4 FAQ☐s and links to address them (without a lot of extra reading required).

I wouldn☐t even put the niceties at the top as some will read those and just delete it thinking of the usual blather that comes from welcome messages and their patience already worn thin.

So after thinking some more about it I would reword my proposed welcome message like this:

Software not working?
http://www.miklor.com/COM/UV_Drivers.php

Want a better antenna?
http://www.miklor.com/uv5r/UV5R-FAQ.php#antenna

Don☐t like the manual? There's an improved version here:
http://www.miklor.com/uv5r/UV5R-Manuals.html

Want to manually program it?
http://www.miklor.com/COM/UV_ProgMem.php
http://www.miklor.com/uv5r/UV5R-ProgFlow.html

Frequently asked questions:
www.miklor.com/uv5r/UV5R-FAQ.php

For more info:
www.miklor.com

Welcome to the Baofeng UV-5R Yahoo Group
This is a GREAT radio with a garbage manual.
If you take the time to read, you can check out the resources below and have few problems. Else, you are almost guaranteed to be frustrated.

We welcome all members, please review this list before membership.

1. You should read the new user tutorial and FAQ below.

2. The USB cable and software can be tricky. Read the tutorial and FAQ.

3. Your other questions are likely answered there, so please look first.

4. Be kind to your fellow list members.

5. PLEASE... NO discussion of LEGALITY of this radio for FRS, GMRS, Maritime, etc operation or FCC part acceptance for part 80, 87, 95, etc. This radio is NOT approved for that use, but it is USA legal for commercial. amateur band and any use as a receiver.
Old, very stale topic.

6. DON'T FEED THE TROLLS who bring up these topics. Just ignore it..

PLEASE Read This Tutorial first: It will save you time and frustration.
UV5R-NewUser Tutorial (Miklor Website)

Guys,

There is a welcome message that is supposed to be sent, but apparently one of the multitude of changes that Yahoo has made to implement the new (neo) interface has disabled sending it.

Greg,

This assumes that you get the notifications in a timely manner, which has not been my experience since about August 7th (when Yahoo started implementing their new interface). It also assumes that your response to the email makes it to Yahoo Groups; I've had the new system loose moderated messages after I approved them, or got the notification after one of the other moderators had already approved the post (the proof of this is the message in question had already been received at my email address).

I moderate all of my groups. I do it in my Inbox. Set your groups to come into your Inbox and to send you alerts when you have things to approve. No problem.

>The new interface is, to me, non-intuitive; and from the general tone of the complaints from those that have pretty much been forced to use it, I'm not the only person that thinks so. All of the functions I generally used were where Yahoo put the partial list of Groups that I am a member of, which means that some of the features that I could get to with one click are now buried in

menus, and some features that Group Moderators used quite extensively simply do not exist; for groups that depend on being able to preview moderated users messages, for example, the lack of this feature alone is reason to complain or find another site that allows to do
that.

If you see someone stuck on the side of the road, you are not required to help. You can keep driving, call 911 or render aide. Even if you do stop, you may not have the knowledge to help the person. What most of us would not do is take our trash and throw it at them as we drove My son has minor cerebral palsy. He cannot change a car tire. You cannot see that there is a physical reason. We do have AAA in case he has a flat, but If you did stop to offer to help, I would hope you wouldn't yell at him for being too stupid to figure it out for himself. If you can't help, just keep on driving. Lori

Here is a really stupid question.. Would you be able to bypass spp and use map? Supposedly ios supports the profile, and from developer.bluetooth.org:

The main scenarios covered by this profile:

- Notifying a remote device of the arrival of a new message on a messaging device.
- Browsing messages in a messaging device.
- Uploading messages onto a messaging device.
- Deleting messages onto a messaging device.
- Sending messages through a remote device.

I am not an apple developer, so no clue if it would work or not, but "sending messages" and "notifying a remote device" look like they could potentially handle everything needed, at least for aprs usage.

btw, have been keeping an eye on your dev work of the mobilinkd, when i have some spare cash, will be ordering one, looks to be a decent little system for the price. I was playing around with BertOS for a bit, looks to be relatively robust with minimal overhead.

33962. Re: [baofeng_uv5r] Where to Find Frequencies to Program UV5R?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 00:49:21 UTC
From: Paul Nourse
Topic: 33866 Message: 33962

Oh my oh my they do not have the permission of the government by way of a license. I trust the majority of people and the ones that are not trustworthy a license will not stop.

Owning a piece of equipment was never illegal. Implying someone will be prone to illegality because they are not following the way (amateur radio tradition) shows just how weak your argument is. I was well versed in amateur radio, electronic theory, and the various rules and regulations for well over 50 years. I bought a radio recently and is the reason I'm studying right now for the extra class license. I am not doing it because I wet my pants and worship govt or the slimy politicians/bureaucrats that infest it. I am doing it because like most people, and probably 100% of the people on this list/group, I am law abiding.

If you want to feel special because you walked the path you feel is correct then knock yourself out. As for me i understand not everyone is the same. Not everyone is as geeky as me.

There really is nothing special about learning. I also have owned other "amateur radios" that I have used but never on amateur frequencies. Oh my I'm implying I may have bent or broken a one size fits all rule. Type 97 yah yah yah. The fact is many people come to ham radio in many ways. One way is no more legitimate than another.

You seem to imply the law abiding who buy the radio first will be prone to joining the dark side. That they somehow do not have all the tools in their toolbox that they need. I know many hams, some of whom don't know their butt from a hole in the ground,. Yet somehow they memorised enough questions to pass. They didn't understand a thing but hey they have their official govt license.

That fact is anyone can learn from any starting point. If you don't have the patience to deal with those people so be it. Others will gladly step in to help.

I suggest you start trusting people more. That is what freedom is all about. And the few that will do illegal things I doubt a license will have any effect on them. Its the reason we call them outlaws, because they don't obey the law!

By the way many people into shortwave listening have ham equipment they use only for listening. Many of those go on to become licensed radio amateurs.

BTW after I am licensed I plan on getting proficient in Morse code. Years ago that would be considered so a$$ backwards. And why was it that way? Only because the govt wanted a large pool of people that knew Morse code they could draw from in case of a draft. Not because it is somehow a better more ethical way of learning but because it was in the best interest to the govt. I can tell you right now I do not work for, or answer to, the govt. It is the govt that is supposed to answer to us aka we the people.

Is it just me that's weird like that? :-)

You all have a great day and enjoy all the great people here. Its those very people that make this list so awesome. I really mean that. :-)

My exercise break and cool down is over so I have to get back to my studies now. Its the last day of my vacation. Actually I enjoy studying this stuff so its been fun sitting home studying instead of working. :-).

Learning the answers to the questions is easy. Actually understanding and learning the subjects is harder. Thank good for search engines and the internet bringing the worlds knowledge to our finger tips. :-)

I'm not worried at all about the tech or general exam. The extra exam does pose a challenge. :-)

>Your best bet is to ask a club or another Ham in your area what the best ones are. Like in the ARRL book they have allot of mistakes. ONe they have a tone in and there is no tone and the other got wiped out by a tornado this April and the repeater was found in a farmers field. they have not and will not put it back up although that property goes up for auction on the 28th it has a cell tower on it with monthly payments coming from the lessees and the abandoned Radio tower. I might go to the auction to see who buys the property as I cant afford it and ask them what they plan on doing with the Radio tower as I know of several

clubs that would love to put a new repeater up there and lease it from them or actually take and buy the stuff from them.

33963. CTCSS/DCS scan weird effect

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 01:14:45 UTC
From: <n4zhg@...>
Topic: 33963 Message: 33963

I have a UV-5R+ and used the Miklor instructions to do a DCS scan. It appears to be scanning frequencies, not DCS codes. Same thing happens for a CTCSS scan.

Any ideas?

Guys,

Ever heard the saying "you can lead a horse to water but you can't make him drink"? It isn't going to matter how much we try to point people in the direction of the answers they seek; some people simply do not seem to understand that they aren't the first person to encounter a given problem, and likely won't be the last, so they ask the same questions over and over again until some folks get tired of seeing the emails in their inboxes (I do, and I'm quite sure that Xaun is too).

Seeing as how the Baofeng is a commercial radio, it is not always necessary to have a ham license, but there are still rules that apply to other radio services. I have my General, although I don't really use it much. I do think that most of your learning comes after getting your ham ticket.

It sounds like you are well on your way to going in without a ham license and coming out with the Extra. I do know several people that have done that. Good luck on everything.

> Oh my oh my they do not have the permission of the government by way of a license. I trust the majority of people and the ones that are not trustworthy a license will not stop.
>
> Owning a piece of equipment was never illegal. Implying someone will be prone to illegality because they are not following the way (amateur radio tradition) shows just how weak your argument is. I was well versed in amateur radio, electronic theory, and the various rules and regulations for well over 50 years. I bought a radio recently and is the reason I'm studying right now for the extra class license. I am not doing it because I wet my pants and worship govt or the slimy politicians/bureaucrats that infest it. I am doing it because like most people, and probably 100% of the people on this list/group, I am law abiding.
>
> If you want to feel special because you walked the path you feel is correct then knock yourself out. As for me i understand not everyone is the same. Not everyone is as geeky as me.
>
> There really is nothing special about learning. I also have owned other "amateur radios" that I have used but never on amateur frequencies. Oh my I'm implying I may have bent or broken a one size fits all rule. Type 97 yah yah yah. The fact is many people come to ham radio in many ways. One way is no more legitimate than another.
>
> You seem to imply the law abiding who buy the radio first will be prone to joining the dark side. That they somehow do not have all the tools in their toolbox that they need. I know many hams, some of whom don't know their butt from a hole in the ground,. Yet somehow they memorised enough questions to pass. They didn't understand a thing but hey they have their official govt license.
>
> That fact is anyone can learn from any starting point. If you don't have the patience to deal with those people so be it. Others will gladly step in to help.
>
> I suggest you start trusting people more. That is what freedom is all about. And the few

that will do illegal things I doubt a license will have any effect on them. Its the reason we call them outlaws, because they don't obey the law!
>
> By the way many people into shortwave listening have ham equipment they use only for listening. Many of those go on to become licensed radio amateurs.
>
> BTW after I am licensed I plan on getting proficient in Morse code. Years ago that would be considered so a$$ backwards. And why was it that way? Only because the govt wanted a large pool of people that knew Morse code they could draw from in case of a draft. Not because it is somehow a better more ethical way of learning but because it was in the best interest to the govt. I can tell you right now I do not work for, or answer to, the govt. It is the govt that is supposed to answer to us aka we the people.

> Your best bet is to ask a club or another Ham in your area what the best ones are. Like in the ARRL book they have allot of mistakes. ONe they have a tone in and there is no tone

and the other got wiped out by a tornado this April and the repeater was found in a farmers field. they have not and will not put it back up although that property goes up for auction on the 28th it has a cell tower on it with monthly payments coming from the lessees and the abandoned Radio tower. I might go to the auction to see who buys the property as I cant afford it and ask them what they plan on doing with the Radio tower as I know of several clubs that would love to put a new repeater up there and lease it from them or actually take and buy the stuff from them.

Oh Ya its that dang Extra exam with 50 question test. I get test anxiety and it dont help. and its the math. I can fix ham radios, build and modify PCB boards for anything, fix CB radios laptops and computers, I can do HTML and all the internet and computer programming but the math when I test just gets to me. Good luck with testing you will make a great Ham and Ham radio will be Happy to have you. You should get on echo link sometimes and let me know what node you are on and we can chat some time. Once you get your licence. Good Luck :)

33969. RE: [baofeng_uv5r] CTCSS/DCS scan weird effect

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 01:40:35 UTC
From: John LaMartina
Topic: 33963 Message: 33969

Select Menu 11 Menu activates the R-CTCSS function, (Menu 10 Menu for DCS)

When the station you are trying to scan is on the air, Press and Hold Scan and it will stop when the code is identified.

Make sure the station is being received when you start this. There’s always the possibility that the station that requires a code for access may not be transmitting one back to you.

Hope this helps.

Subject: [baofeng_uv5r] CTCSS/DCS scan weird effect

I have a UV-5R+ and used the Miklor instructions to do a DCS scan. It appears to be scanning frequencies, not DCS codes. Same thing happens for a CTCSS scan.

Any ideas?

It doesn't sound like you are in menu 10 (when scanning for DCS codes) or
menu 11 (when scanning for CTCSS tones) when you initiate the scan.

But we already know that someone asking a question here either already knows how to read or knows someone that can do it for them, otherwise the question would not have been asked.

BTW, I almost always try to help in a roadside situation in one way or another if I can. There could be many reasons for not being able to change a tire, from disabilities, to equipment malfunctions, to no equipment, etc.

I have done Search and Rescue since 1988 and have worked ARES/Races since getting licensed. I know how to help people.

You make a valid point Yahoo being unstable. I don't the status of Google groups but one might consider moving over there. I monitor about 25 groups and I would sure hate to see them go away.

Rob,

You see it as being stuck in the last decade; I see it as being one of the last sites that was friendly to people with physical disabilites of all sorts, as well as a clean no frills interface that did what I needed with minimal effort. Why did it truly need "upgraded" and why couldn't they have the simple courtesy of asking for testers instead of simply choosing people at random and switch their accounts to use the new interface? Yahoo did the same thing with the update to Yahoo Mail, making it harder for people instead of easier, for many of the same reasons.

I like the changes. The old groups interface was stuck in the last decade, trying to maintain compatibility with outdated browsers. Neo makes navigation and searching more intuitive for me. There are some missing features and, tes, from time to time a few things break for short periods of time. They are responding to user feedback and making fixes/enhancements on the fly. But, overall, I like Neo a lot more than the "classic" interface. I still think the interface is bit bloated. I like the simple look and feel of Google groups. But Google provides fewer features than Yahoo so their interface ought to be more sparse.

Reading through the feedback page you link to, Yahoo seem to be responding well to feedback. The vitriol from the users is disappointing to see, but seems to the norm on the internet.

14/09/2013 12:58

Yahoo has changed the Groups interface to something called NEO.

Many features have been lost, and some just plain do not work.

It is a nightmare for Group Owners and Moderators also.

Please go to:

http://yahoo.uservoice.com/forums/209451

and add your votes on the dismal new interface.

You can vote 1,2, or 3 votes per topic. And you get 50 votes.

Yup and if you cant and are not in cell service get on the radio and find someone who can. I have done that many of times. Even when there has been an accident on the freeway. I get on and let everyone know about whats going on in case they are headed that way.

Oh my oh my they do not have the permission of the government by way of a license. I trust the majority of people and the ones that are not trustworthy a license will not stop.

Owning a piece of equipment was never illegal. Implying someone will be prone to illegality because they are not following the way (amateur radio tradition) shows just how weak your argument is. I was well versed in amateur radio, electronic theory, and the various rules and regulations for well over 50 years. I bought a radio recently and is the reason I'm studying right now for the extra class license. I am not doing it because I wet my pants and worship govt or the slimy politicians/bureaucrats that infest it. I am doing it because like most people, and probably 100% of the people on this list/group, I am law abiding.

If you want to feel special because you walked the path you feel is correct then knock yourself out. As for me i understand not everyone is the same. Not everyone is as geeky as me.

There really is nothing special about learning. I also have owned other "amateur radios" that I have used but never on amateur frequencies. Oh my I'm implying I may have bent or broken a one size fits all rule. Type 97 yah yah yah. The fact is many people come to ham radio in many ways. One way is no more legitimate than another.

You seem to imply the law abiding who buy the radio first will be prone to joining the dark side. That they somehow do not have all the tools in their toolbox that they need. I know many hams, some of whom don't know their butt from a hole in the ground,. Yet somehow they memorised enough questions to pass. They didn't understand a thing but hey they have their official govt license.

That fact is anyone can learn from any starting point. If you don't have the patience to deal with those people so be it. Others will gladly step in to help.

I suggest you start trusting people more. That is what freedom is all about. And the few that will do illegal things I doubt a license will have any effect on them. Its the reason we call them outlaws, because they don't obey the law!

By the way many people into shortwave listening have ham equipment they use only for listening. Many of those go on to become licensed radio amateurs.

BTW after I am licensed I plan on getting proficient in Morse code. Years ago that would be considered so a$$ backwards. And why was it that way? Only because the govt wanted a large pool of people that knew Morse code they could draw from in case of a draft. Not because it is somehow a better more ethical way of learning but because it was in the best interest to the govt. I can tell you right now I do not work for, or answer to, the govt. It is the govt that is supposed to answer to us aka we the people.

Is it just me that's weird like that? :-)

You all have a great day and enjoy all the great people here. Its those very people that make this list so awesome. I really mean that. :-)

My exercise break and cool down is over so I have to get back to my studies now. Its the last day of my vacation. Actually I enjoy studying this stuff so its been fun sitting home studying instead of working. :-).

Learning the answers to the questions is easy. Actually understanding and learning the subjects is harder. Thank good for search engines and the internet bringing the worlds knowledge to our finger tips. :-)

I'm not worried at all about the tech or general exam. The extra exam does pose a challenge. :-)

I dont take it out of any bands, I used work for A repair place which had all it needs to do all of this at one time. I will do it for others at home. I also know allot of people with home based businesses that repair CB and Ham radios and they are just ham radio operators. With a business licence to work from home. They fix it for trucking companies and police fire etc in there communities not allot of those around here. I do minor repairs to CBs and more extensive for ham radios I was licensed way back when then got married had kids and let my licence lapse. I was a ham before I was 12. But at 22 it exp. I just recently got it again but had to start all over again.

33977. For Sale

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 02:24:53 UTC
From: Jim K5JG
Topic: 33866 Message: 33977

I have decided to sell the following Baofeng radio and accessories:

1 - BF-F9 (UV-5R from Three Old Crows) with all original accessories
1 - Extra Baofeng 1800 mA standard battery
1 - Baofeng Speaker/Mic
1 - Baofeng AA battery case
1 - Nagoya 701 antenna
1 - Diamond SRJF10 flexible stubby antenna

All items are less than four months old, are in excellent condition, and will come with the original packaging and documentation.

If interested, please contact me directly at k5jg@....

Thanks.

73, Jim K5JG

Are you using CHIRP? If so do you have Memory Range (at the upper left of the Memories editor) set to something like 0-40 or 1-40? Change it to 0-127 and CHIRP will display all 128 channels.

Likewise for me. No problem with cable, once I got the right drivers set up with CHIRP.

I happen to enjoy math, so when I saw math questions on my Extra exam I was happy, since I knew that would increase my odds of passing the exam (after many years just sitting at Advanced), but here's some news for you folks worried about the math portions of your exams.

You can get every single math question wrong on your Technician, General, or Extra class license test - and still pass. Naturally you'll need to score near 100% on everything else (in that particular exam), but don't worry that missing a couple of math questions (on any of the exam's) will kill your chances of passing.

Jim,

is it possible to put this radio into "banks" with the CHIRP software or
the likes?

Jeff KE7OUR

Being a ham doesn't confer anything other than a govt blessing that isn't worth diddley. I learned electronics as a kid because I liked it. I stared out building electronic circuits, kits etc. Then graduated to swl and other pursuits. Got interested in ham radio and studied that. Just never pursued the code long enough or hard enough to get a ticket. Some people learn after getting into radio. Other before. Some have the knowledge and schooling that getting into it is child's play. My high school physics teacher was a radio operator during WWII. He went from zero to extra class in no time flat. His code speed was phenomenal. Basically different stroke for different folks. In motorcycling its not important what you, its important that you ride. Same goes for ham radio. Doesn't mater how you got here or how you started. What matters it that you're here. :-)

Echo link now that new. Well way different than years ago. Being an IT guy I'm looking forward to the computer side of ham radio. Also learning the code and trying cw on a homemade transmitter. I wonder if my 1945 Hallicrafters Super Defiant is up to the task. I rebuilt it in 1981 just after meeting my wife. I showed her the radio and an old wax capacitor went up in smoke. :-). Rebuilt it completely. Still going strong. As a teenager I knew an old retired radio repairman that educated me in the ways of the vacuum tubes. I have a very very nice tube tester I bought from him. First time I showed my kids the radio they freaked out. When the tubes lite up they thought to was on fire. LOL :-) I love high tech and also dig low tech. Sometimes low tech rules! :-)

I can fix ham radios, build and modify PCB boards for anything, fix CB radios laptops and computers, I can do HTML and all the internet and computer programming but the math when I test just gets to me. Good luck with testing you will make a great Ham and Ham radio will be Happy to have you. You should get on echo link sometimes and let me know what node you are on and we can chat some time. Once you get your licence. Good Luck :)

"Being a ham doesn't confer anything other than a govt blessing that isn't worth diddley."

Paul, I agree with alot of what you said, but I disagree that your ham license (once you get one) isn't worth diddley.

Depending on your license level and the frequency band you are using, you will be authorized to use up to 1500 watts PEP. Try doing that very long on 11 meters and see how long before the TVI complaints from the neighbors result in a visit from Uncle Sam. The same is true for frequency allocations. While some folks on 11 meters (CB) are perfectly content to run legal power (12 watts PEP) and exist within a very small bandwidth allocation (about 500 KHz last I checked), even the beginning level amateur license (Technician) gives you far more bandwidth and much higher (legal) power levels. As your license level increases, so will both your frequency allocation amounts and power levels.

It's true that both the advent of solid state and now digital voice technologies have changed amateur radio (vs. 30 plus years ago when I entered the hobby). With your computer background, you may well end up loving D-Star, EchoLink, IRLP, or Packet, but that's the great thing about ham radio, there are so many different "sub-hobbies" within the hobby that very few hams are exactly alike in their all of their interests, plus your interests can change over time.

When I first got in, I rushed to get into HF and immediately built a 10,15, and 20m tri-band 4-element quad beam antenna from an old design I found. Worked stations all over the world with that antenna at just 40 feet, but gradually my interest shifted to VHF/UHF communications and stayed there for years. Of course, different jobs, starting a family, and moving probably also affected my time for radio as well.

One day about two years ago at Quartzfest, I ran into Gordon West (WB6NOA) who was also going on an off-road 4WD ride with us later that weekend. Gordo kept telling me about their "HamNation" weekly show (just google it if you are interested) and kept telling me I should upgrade from Advanced to Extra to get more of the "DX" HF frequencies that aren't available to the General or Advanced class license holders. Long story short, between Gordo's prodding about the extra "DX" band space and me watching the shows every week, my interest is once again back into HF.

My point is don't be too sure that what you think about the hobby today will be exactly what you think about the hobby even 6 months from now, your opinion might very well change. Who knows, once you get your license, maybe we'll work each other on the air someday!

Can you give more details on which one you bought from Amazon. There are a lot of dealers on their and not sure which one to go with.

Thanks for your time,

Tom

I disagree, I bought my cable from amazon and had no problems at all.

On Sat, Sep 14, 2013 at 12:00 PM, Bob Holmes <keystone_kid16@...> wrote:

George,

You know what is sad here is that the transaction in general makes Amazon look bad and they actually have no knowledge that the vendor has a supply of poorly made cables being sold all over the map. Same scenario goes for Ebay. It all falls on the shoulders of the vendor in any case. Finally, the best place to buy, as you mentioned, is from Kurt at Three Old Crows.

Yes I made the mistake of ordering one from Amazon. (Programming cable that is). Fortunately Amazon gave me no hassles in returning it. Most likely I will be placing an order today for one from three old crows in Texas. I'd like to thank all the members in the group for helping me in this matter.

Thanks and I agree with most of what you said. However I didn't mean being a ham wasn't worth it. I think it is very worthwhile.

You wrote "you will be authorized" from whom... govt. The federal govt has grown so large that it is now crushing businesses and people. I know we need frequency coordination and the FCC is probably one of the better agencies. What bothers me is congress no longer cares and has delegated much of its authority to unelected bureaucrats in the FCC and other alphabet agencies. Congress has no constitutional authority to do that and many other things it does and that's my point. I work under the color of law and just like the FCC I don't care about minor stuff that does not matter. Some people think its their duty to narc on someone who is jaywalking. Most of the time the narcs have no clue or idea of the intent of law, rules and regulations. Nor the differences between them. If i pass the extra class exam I'll feel great yet its only a piece of paper from part of the govt. Will it let me work the airwaves without fear of big brother crushing me to make an example? Sure. Is that licence the source of my enjoyment? Heck no. My interests and motivation into ham radio are not affected one bit by govt approval, sanction or any other action.

Yeah be proud of your accomplishments but don't get all hung up on the part about govt giving you permission to enjoy life. Permission to start a business etc etc etc. So many get all bent when someone uses a part 97 radio for another purpose just because govt has a rule. We shouldn't look to govt for every move we make. Govt doesn't have all the answers, only one size fits all decrees. In fact govt relies on the amateurs themselves to do the FCC's work. To police their own spectrum. In my opinion we should worry about real threats to the spectrum rather than very minor and petty infractions. Think like a jury rather than act like FCC Nazi's.

Rule are rules people bother me because it shows a complete lack of common sense and perspective. As for me I decided a long time ago to grow a pair and not look to daddy govt to tell me what to do. Its our job to tell our ,servant government what we expect. Mostly its about perspective.

If I pass I'll be strutting my stuff. The license itself isn't anything special.

>Paul, I agree with alot of what you said, but I disagree that your ham license (once you get one) isn't worth diddley.
>
>Depending on your license level and the frequency band you are using, you will be authorized to use up to 1500 watts PEP. Try doing that very long on 11 meters and see how long before the TVI complaints from the neighbors result in a visit from Uncle Sam. The

same is true for frequency allocations. While some folks on 11 meters (CB) are perfectly content to run legal power (12 watts PEP) and exist within a very small bandwidth allocation (about 500 KHz last I checked), even the beginning level amateur license (Technician) gives you far more bandwidth and much higher (legal) power levels. As your license level increases, so will both your frequency allocation amounts and power levels.
>
>It's true that both the advent of solid state and now digital voice technologies have changed amateur radio (vs. 30 plus years ago when I entered the hobby). With your computer background, you may well end up loving D-Star, EchoLink, IRLP, or Packet, but that's the great thing about ham radio, there are so many different "sub-hobbies" within the hobby that very few hams are exactly alike in their all of their interests, plus your interests can change over time.
>
>When I first got in, I rushed to get into HF and immediately built a 10,15, and 20m tri-band 4-element quad beam antenna from an old design I found. Worked stations all over the world with that antenna at just 40 feet, but gradually my interest shifted to VHF/UHF communications and stayed there for years. Of course, different jobs, starting a family, and moving probably also affected my time for radio as well.
>
>One day about two years ago at Quartzfest, I ran into Gordon West (WB6NOA) who was also going on an off-road 4WD ride with us later that weekend. Gordo kept telling me about their "HamNation" weekly show (just google it if you are interested) and kept telling me I should upgrade from Advanced to Extra to get more of the "DX" HF frequencies that aren't available to the General or Advanced class license holders. Long story short, between Gordo's prodding about the extra "DX" band space and me watching the shows every week, my interest is once again back into HF.
>
>My point is don't be too sure that what you think about the hobby today will be exactly what you think about the hobby even 6 months from now, your opinion might very well change. Who knows, once you get your license, maybe we'll work each other on the air someday!

>Echo link now that new. Well way different than years ago. Being an IT guy I'm looking forward to the computer side of ham radio. Also learning the code and trying cw on a homemade transmitter. I wonder if my 1945 Hallicrafters Super Defiant is up to the task. I rebuilt it in 1981 just after meeting my wife. I showed her the radio and an old wax capacitor went up in smoke. :-). Rebuilt it completely. Still going strong. As a teenager I knew an old retired radio repairman that educated me in the ways of the vacuum tubes. I have a very very nice tube tester I bought from him. First time I showed my kids the radio they freaked out. When the tubes lite up they thought to was on fire. LOL :-) I love high tech and also dig low tech. Sometimes low tech rules! :-)

I can fix ham radios, build and modify PCB boards for anything, fix CB radios laptops and computers, I can do HTML and all the internet and computer programming but the math when I test just gets to me. Good luck with testing you will make a great Ham and Ham radio will be Happy to have you. You should get on echo link sometimes and let me know what node you are on and we can chat some time. Once you get your licence. Good Luck :)

>
>Owning a piece of equipment was never illegal. Implying someone will be prone to illegality because they are not following the way (amateur radio tradition) shows just how weak your argument is. I was well versed in amateur radio, electronic theory, and the various rules and regulations for well over 50 years. I bought a radio recently and is the reason I'm studying right now for the extra class license. I am not doing it because I wet my pants and worship govt or the slimy politicians/bureaucrats that infest it. I am doing it because like most people, and probably 100% of the people on this list/group, I am law abiding.
>
>
>If you want to feel special because you walked the path you feel is correct then knock yourself out. As for me i understand not everyone is the same. Not everyone is as geeky as me.
>
>
>There really is nothing special about learning. I also have owned other "amateur radios" that I have used but never on amateur frequencies. Oh my I'm implying I may have bent or broken a one size fits all rule. Type 97 yah yah yah. The fact is many people come to ham radio in many ways. One way is no more legitimate than another.
>
>
>You seem to imply the law abiding who buy the radio first will be prone to joining the

dark side. That they somehow do not have all the tools in their toolbox that they need. I know many hams, some of whom don't know their butt from a hole in the ground,. Yet somehow they memorised enough questions to pass. They didn't understand a thing but hey they have their official govt license.
>
>
>That fact is anyone can learn from any starting point. If you don't have the patience to deal with those people so be it. Others will gladly step in to help.
>
>
>I suggest you start trusting people more. That is what freedom is all about. And the few that will do illegal things I doubt a license will have any effect on them. Its the reason we call them outlaws, because they don't obey the law!
>
>
>By the way many people into shortwave listening have ham equipment they use only for listening. Many of those go on to become licensed radio amateurs.
>
>
>BTW after I am licensed I plan on getting proficient in Morse code. Years ago that would be considered so a$$ backwards. And why was it that way? Only because the govt wanted a large pool of people that knew Morse code they could draw from in case of a draft. Not because it is somehow a better more ethical way of learning but because it was in the best interest to the govt. I can tell you right now I do not work for, or answer to, the govt. It is the govt that is supposed to answer to us aka we the people.

Bob,

The cable problem (on Amazon, e-Bay, etc.) is normally due to sellers there dropping their prices over and over until their profits are coming more from the shipping fees vs. the actual hardware, and then some even go farther by offering free shipping, so the only way for them to stay in business is by selling the fake Prolific chipped cables to hit the Amazon or e-Bay price points. Even then, 99% of those fake cables "can" work, it's normally the end-user's that don't understand that the fake Prolific cables take a few extra steps to get working.

Kurt at TOC sells a higher cost (but genuine Prolific or FTDI cable), so naturally his cables work with far fewer problems reported, but to be fair, you'd expect a $20.00 cable to work better than a $3.00 cable no matter who sells it. The problem that Amazon, e-Bay and others have is that they are totally unprepared in separating "fake" vs. real "genuine" cables, and none of their suppliers is going to tell them their $3.00 cables are using fake chip-sets, they simply want the "Buy-Box" on Amazon or e-Bay.

I could make a new listing on Amazon or e-Bay tomorrow and put in the description "Real" or "Genuine" and three things would happen:

One, it would not stop anyone else from listing a clone cable at a cheaper price within my ad, and
Two, most new buyers would immediately buy the "cheaper" cable from a competitor in my listing and never know they were getting the "cloned" cable, and
Three, if those users searched Amazon or e-Bay a little further, they would find even cheaper cables listed for sale and assume they are the same, after all they look the same and again NO sellers list (within their ad) that their cables are the cheap clone cables that require a little extra to get the driver to work properly.

To be fair, Amazon and e-Bay have the same issue with many other non-serialized products. Just try buying a "real" HP toner cartridge and half the time you'll get either a cheap re-fill (that was advertized as new in box) or you'll get a generic toner in generic box.

We don't want ham radio to become the same as what CB has become. There are alot of CBers that operate illegally with their amps and "funny channels", etc, that could do even more legally as a General. If they are smart enough to do it on CB, they could probably pass their Tech and General tests quite easily. It is easy enough to follow a few simple rules that just make life a little bit easier. I suppose you could go back in time before there were a bunch of rules or laws and see how much havoc there was. Oh well...

On Sep 15, 2013, at 2:21, Paul Nourse <paul@...> wrote:

> Thanks and I agree with most of what you said. However I didn't mean being a ham wasn't worth it. I think it is very worthwhile.
>
> You wrote "you will be authorized" from whom... govt. The federal govt has grown so large that it is now crushing businesses and people. I know we need frequency coordination and the FCC is probably one of the better agencies. What bothers me is congress no longer cares and has delegated much of its authority to unelected bureaucrats in the FCC and other alphabet agencies. Congress has no constitutional authority to do that and many other things it does and that's my point. I work under the color of law and just like the FCC I don't care about minor stuff that does not matter. Some people think its their duty to narc on someone who is jaywalking. Most of the time the narcs have no clue or idea of the intent of law, rules and regulations. Nor the differences between them. If i pass the extra class exam I'll feel great yet its only a piece of paper from part of the govt. Will it let me work the airwaves without fear of big brother crushing me to make an example? Sure. Is that licence the source of my enjoyment? Heck no. My interests and motivation into ham radio are not affected one bit by govt approval, sanction or any other action.
>
> Yeah be proud of your accomplishments but don't get all hung up on the part about govt giving you permission to enjoy life. Permission to start a business etc etc etc. So many get all bent when someone uses a part 97 radio for another purpose just because govt has a rule. We shouldn't look to govt for every move we make. Govt doesn't have all the answers, only one size fits all decrees. In fact govt relies on the amateurs themselves to do the FCC's work. To police their own spectrum. In my opinion we should worry about real threats to the spectrum rather than very minor and petty infractions. Think like a jury rather than act like FCC Nazi's.
>
> Rule are rules people bother me because it shows a complete lack of common sense and perspective. As for me I decided a long time ago to grow a pair and not look to daddy govt to tell me what to do. Its our job to tell our ,servant government what we expect. Mostly its about perspective.
>

>
> Depending on your license level and the frequency band you are using, you will be authorized to use up to 1500 watts PEP. Try doing that very long on 11 meters and see how long before the TVI complaints from the neighbors result in a visit from Uncle Sam. The same is true for frequency allocations. While some folks on 11 meters (CB) are perfectly content to run legal power (12 watts PEP) and exist within a very small bandwidth allocation (about 500 KHz last I checked), even the beginning level amateur license (Technician) gives you far more bandwidth and much higher (legal) power levels. As your license level increases, so will both your frequency allocation amounts and power levels.
>
> It's true that both the advent of solid state and now digital voice technologies have changed amateur radio (vs. 30 plus years ago when I entered the hobby). With your computer background, you may well end up loving D-Star, EchoLink, IRLP, or Packet, but that's the great thing about ham radio, there are so many different "sub-hobbies" within the hobby that very few hams are exactly alike in their all of their interests, plus your interests can change over time.
>
> When I first got in, I rushed to get into HF and immediately built a 10,15, and 20m tri-band 4-element quad beam antenna from an old design I found. Worked stations all over the world with that antenna at just 40 feet, but gradually my interest shifted to VHF/UHF communications and stayed there for years. Of course, different jobs, starting a family, and moving probably also affected my time for radio as well.
>
> One day about two years ago at Quartzfest, I ran into Gordon West (WB6NOA) who was also going on an off-road 4WD ride with us later that weekend. Gordo kept telling me about their "HamNation" weekly show (just google it if you are interested) and kept telling me I should upgrade from Advanced to Extra to get more of the "DX" HF frequencies that aren't available to the General or Advanced class license holders. Long story short, between Gordo's prodding about the extra "DX" band space and me watching the shows every week, my interest is once again back into HF.
>
> My point is don't be too sure that what you think about the hobby today will be exactly what you think about the hobby even 6 months from now, your opinion might very well change. Who knows, once you get your license, maybe we'll work each other on the air someday!

>> Echo link now that new. Well way different than years ago. Being an IT guy I'm looking forward to the computer side of ham radio. Also learning the code and trying cw on a homemade transmitter. I wonder if my 1945 Hallicrafters Super Defiant is up to the task. I rebuilt it in 1981 just after meeting my wife. I showed her the radio and an old wax capacitor went up in smoke. :-). Rebuilt it completely. Still going strong. As a teenager I knew an old retired radio repairman that educated me in the ways of the vacuum tubes. I have a very very nice tube tester I bought from him. First time I showed my kids the radio they freaked out. When the tubes lite up they thought to was on fire. LOL :-) I love high tech and also dig low tech. Sometimes low tech rules! :-)

>>>
>>> Oh my oh my they do not have the permission of the government by way of a license. I trust the majority of people and the ones that are not trustworthy a license will not stop.
>>>
>>> Owning a piece of equipment was never illegal. Implying someone will be prone to illegality because they are not following the way (amateur radio tradition) shows just how weak your argument is. I was well versed in amateur radio, electronic theory, and the various rules and regulations for well over 50 years. I bought a radio recently and is the reason I'm studying right now for the extra class license. I am not doing it because I wet my pants and worship govt or the slimy politicians/bureaucrats that infest it. I am doing it because like most people, and probably 100% of the people on this list/group, I am law abiding.
>>>
>>> If you want to feel special because you walked the path you feel is correct then knock yourself out. As for me i understand not everyone is the same. Not everyone is as geeky as me.
>>>
>>> There really is nothing special about learning. I also have owned other "amateur radios" that I have used but never on amateur frequencies. Oh my I'm implying I may have bent or broken a one size fits all rule. Type 97 yah yah yah. The fact is many people come to ham radio in many ways. One way is no more legitimate than another.

>>>
>>> You seem to imply the law abiding who buy the radio first will be prone to joining the dark side. That they somehow do not have all the tools in their toolbox that they need. I know many hams, some of whom don't know their butt from a hole in the ground,. Yet somehow they memorised enough questions to pass. They didn't understand a thing but hey they have their official govt license.
>>>
>>> That fact is anyone can learn from any starting point. If you don't have the patience to deal with those people so be it. Others will gladly step in to help.
>>>
>>> I suggest you start trusting people more. That is what freedom is all about. And the few that will do illegal things I doubt a license will have any effect on them. Its the reason we call them outlaws, because they don't obey the law!
>>>
>>> By the way many people into shortwave listening have ham equipment they use only for listening. Many of those go on to become licensed radio amateurs.
>>>
>>> BTW after I am licensed I plan on getting proficient in Morse code. Years ago that would be considered so a$$ backwards. And why was it that way? Only because the govt wanted a large pool of people that knew Morse code they could draw from in case of a draft. Not because it is somehow a better more ethical way of learning but because it was in the best interest to the govt. I can tell you right now I do not work for, or answer to, the govt. It is the govt that is supposed to answer to us aka we the people.
>>>
>>> Is it just me that's weird like that? :-)
>>>
>>> You all have a great day and enjoy all the great people here. Its those very people that make this list so awesome. I really mean that. :-)
>>>
>>> My exercise break and cool down is over so I have to get back to my studies now. Its the last day of my vacation. Actually I enjoy studying this stuff so its been fun sitting home studying instead of working. :-).
>>>
>>> Learning the answers to the questions is easy. Actually understanding and learning the subjects is harder. Thank good for search engines and the internet bringing the worlds knowledge to our finger tips. :-)

>>> Your best bet is to ask a club or another Ham in your area what the best ones are. Like in the ARRL book they have allot of mistakes. ONe they have a tone in and there is no tone and the other got wiped out by a tornado this April and the repeater was found in a farmers field. they have not and will not put it back up although that property goes up for auction on the 28th it has a cell tower on it with monthly payments coming from the lessees and the abandoned Radio tower. I might go to the auction to see who buys the property as I cant afford it and ask them what they plan on doing with the Radio tower as I know of several clubs that would love to put a new repeater up there and lease it from them or actually take and buy the stuff from them.

Genuine isn't always better. In the case of the Baofeng cable it is, sure. As far as ink and toner your usually way better off going generic. For my inkjet printers buy genuine is a guaranteed to be ripped off. Buy enough ink cartridges til you have a gallon of ink and it will cost you way more than a thousand dollars. Ink does not cost anywhere near that price. The manufacturers make no money on the actual printer. They make profit on the ink. The Baofeng radios are proof bargains exist

Same scenario goes for Ebay. It all falls on the shoulders of the vendor in any case. Finally, the best place to buy, as you mentioned, is from Kurt at Three Old Crows.

There was havoc because it was the era of spark gap transmitters and radios that were no where refined as what we have today.

Yes we need rules. Though Congress should be making them. When the FCC makes a rule its made by fallible unelected men not gods. Most times they are one size fits all, meaning crude. Even the FCC uses common sense when enforcing their rules. We should do the same.

The CB band is like the wild west because no one polices it. How fast do you think a few hams can triangulate a rouge transmitter. Pretty darn fast and that is why the ham bands are safe from yahoos. Do you think those CB yahoos are being stopped by rules? There are plenty of rules and regulations that cover the CB bands so I guess there is no problem right. The point is minor infractions are not worth worrying about. Real interference is. Again, who does the grunt work of policing on the Ham bands... hams of course.

Jardy Dawson <JARDY72@YAHOO.COM> wrote:

>
>
>We don't want ham radio to become the same as what CB has become. There are alot of CBers that operate illegally with their amps and "funny channels", etc, that could do even more legally as a General. If they are smart enough to do it on CB, they could probably pass their Tech and General tests quite easily. It is easy enough to follow a few simple rules that just make life a little bit easier. I suppose you could go back in time before there were a bunch of rules or laws and see how much havoc there was. Oh well...

>
>You wrote "you will be authorized" from whom... govt. The federal govt has grown so large that it is now crushing businesses and people. I know we need frequency coordination and

the FCC is probably one of the better agencies. What bothers me is congress no longer cares and has delegated much of its authority to unelected bureaucrats in the FCC and other alphabet agencies. Congress has no constitutional authority to do that and many other things it does and that's my point. I work under the color of law and just like the FCC I don't care about minor stuff that does not matter. Some people think its their duty to narc on someone who is jaywalking. Most of the time the narcs have no clue or idea of the intent of law, rules and regulations. Nor the differences between them. If i pass the extra class exam I'll feel great yet its only a piece of paper from part of the govt. Will it let me work the airwaves without fear of big brother crushing me to make an example? Sure. Is that licence the source of my enjoyment? Heck no. My interests and motivation into ham radio are not affected one bit by govt approval, sanction or any other action.
>
>
>Yeah be proud of your accomplishments but don't get all hung up on the part about govt giving you permission to enjoy life. Permission to start a business etc etc etc. So many get all bent when someone uses a part 97 radio for another purpose just because govt has a rule. We shouldn't look to govt for every move we make. Govt doesn't have all the answers, only one size fits all decrees. In fact govt relies on the amateurs themselves to do the FCC's work. To police their own spectrum. In my opinion we should worry about real threats to the spectrum rather than very minor and petty infractions. Think like a jury rather than act like FCC Nazi's.
>
>
>Rule are rules people bother me because it shows a complete lack of common sense and perspective. As for me I decided a long time ago to grow a pair and not look to daddy govt to tell me what to do. Its our job to tell our ,servant government what we expect. Mostly its about perspective.

>
>Depending on your license level and the frequency band you are using, you will be authorized to use up to 1500 watts PEP. Try doing that very long on 11 meters and see how long before the TVI complaints from the neighbors result in a visit from Uncle Sam. The same is true for frequency allocations. While some folks on 11 meters (CB) are perfectly content to run legal power (12 watts PEP) and exist within a very small bandwidth allocation (about 500 KHz last I checked), even the beginning level amateur license

(Technician) gives you far more bandwidth and much higher (legal) power levels. As your license level increases, so will both your frequency allocation amounts and power levels.
>
>It's true that both the advent of solid state and now digital voice technologies have changed amateur radio (vs. 30 plus years ago when I entered the hobby). With your computer background, you may well end up loving D-Star, EchoLink, IRLP, or Packet, but that's the great thing about ham radio, there are so many different "sub-hobbies" within the hobby that very few hams are exactly alike in their all of their interests, plus your interests can change over time.
>
>When I first got in, I rushed to get into HF and immediately built a 10,15, and 20m tri-band 4-element quad beam antenna from an old design I found. Worked stations all over the world with that antenna at just 40 feet, but gradually my interest shifted to VHF/UHF communications and stayed there for years. Of course, different jobs, starting a family, and moving probably also affected my time for radio as well.
>
>One day about two years ago at Quartzfest, I ran into Gordon West (WB6NOA) who was also going on an off-road 4WD ride with us later that weekend. Gordo kept telling me about their "HamNation" weekly show (just google it if you are interested) and kept telling me I should upgrade from Advanced to Extra to get more of the "DX" HF frequencies that aren't available to the General or Advanced class license holders. Long story short, between Gordo's prodding about the extra "DX" band space and me watching the shows every week, my interest is once again back into HF.
>
>My point is don't be too sure that what you think about the hobby today will be exactly what you think about the hobby even 6 months from now, your opinion might very well change. Who knows, once you get your license, maybe we'll work each other on the air someday!

>Echo link now that new. Well way different than years ago. Being an IT guy I'm looking forward to the computer side of ham radio. Also learning the code and trying cw on a homemade transmitter. I wonder if my 1945 Hallicrafters Super Defiant is up to the task. I rebuilt it in 1981 just after meeting my wife. I showed her the radio and an old wax capacitor went up in smoke. :-). Rebuilt it completely. Still going strong. As a teenager I knew an old retired radio repairman that educated me in the ways of the vacuum tubes. I have a very very nice tube tester I bought from him. First time I showed my kids the radio they freaked out. When the tubes lite up they thought to was on fire. LOL :-) I love high tech and also dig low tech. Sometimes low tech rules! :-)

>
>Owning a piece of equipment was never illegal. Implying someone will be prone to illegality because they are not following the way (amateur radio tradition) shows just how weak your argument is. I was well versed in amateur radio, electronic theory, and the various rules and regulations for well over 50 years. I bought a radio recently and is the reason I'm studying right now for the extra class license. I am not doing it because I wet my pants and worship govt or the slimy politicians/bureaucrats that infest it. I am doing it because like most people, and probably 100% of the people on this list/group, I am law abiding.
>
>
>If you want to feel special because you walked the path you feel is correct then knock yourself out. As for me i understand not everyone is the same. Not everyone is as geeky as me.
>
>
>There really is nothing special about learning. I also have owned other "amateur radios" that I have used but never on amateur frequencies. Oh my I'm implying I may have bent or broken a one size fits all rule. Type 97 yah yah yah. The fact is many people come to ham radio in many ways. One way is no more legitimate than another.
>
>
>You seem to imply the law abiding who buy the radio first will be prone to joining the dark side. That they somehow do not have all the tools in their toolbox that they need. I know many hams, some of whom don't know their butt from a hole in the ground,. Yet somehow they memorised enough questions to pass. They didn't understand a thing but hey they have

their official govt license.
>
>
>That fact is anyone can learn from any starting point. If you don't have the patience to deal with those people so be it. Others will gladly step in to help.
>
>
>I suggest you start trusting people more. That is what freedom is all about. And the few that will do illegal things I doubt a license will have any effect on them. Its the reason we call them outlaws, because they don't obey the law!
>
>
>By the way many people into shortwave listening have ham equipment they use only for listening. Many of those go on to become licensed radio amateurs.
>
>
>BTW after I am licensed I plan on getting proficient in Morse code. Years ago that would be considered so a$$ backwards. And why was it that way? Only because the govt wanted a large pool of people that knew Morse code they could draw from in case of a draft. Not because it is somehow a better more ethical way of learning but because it was in the best interest to the govt. I can tell you right now I do not work for, or answer to, the govt. It is the govt that is supposed to answer to us aka we the people.

>Your best bet is to ask a club or another Ham in your area what the best ones are. Like in the ARRL book they have allot of mistakes. ONe they have a tone in and there is no tone and the other got wiped out by a tornado this April and the repeater was found in a farmers field. they have not and will not put it back up although that property goes up for auction on the 28th it has a cell tower on it with monthly payments coming from the lessees and the abandoned Radio tower. I might go to the auction to see who buys the property as I cant afford it and ask them what they plan on doing with the Radio tower as I know of several clubs that would love to put a new repeater up there and lease it from them or actually take and buy the stuff from them.

In Australia it is. It is an offence to be possession of a
transmitter for which you don't have a current licence.

Hmmm.kind of expensive if you wanted to use a bluetooth serial adapter (compared to the radio and cable):

http://gridconnect.com/bluetooth-to-rs232.html

Could go cheaper if you provide your own power:

https://gridconnect.com/serial-to-bluetooth.html?gdftrk=gdfV25227_a_7c1592_a_7c6907_a_7c720
<https://gridconnect.com/serial-to-bluetooth.html?gdftrk=gdfV25227_a_7c1592_a_7c6907_a_7c720&utm_source=google&utm_medium=CPC&utm_term=%7bkeyword%7d&utm_campaign=%2FUI%2FProduct+Listing+Ads+General+All&mm_campaign=477cea803cb14c83d8a99b6c7d0cd349&keyword=%7bkeyword%7d&mkwid=%7bifsearch:s%7d%7bifcontent:c%7dt3X4DDFr_d%7bdevice%7d|pcrid|18638691793&gclid=CIXz-YG6zbkCFUdgMgodLDQAFQ>
&utm_source=google&utm_medium=CPC&utm_term={keyword}&utm_campaign=%2FUI%2FProduct+Listing+Ads+General+All&mm_campaign=477cea803cb14c83d8a99b6c7d0cd349&keyword={keyword}&mkwid={ifsearch:s}{ifcontent:c}t3X4DDFr_d{device}|pcrid|18638691793&gclid=CIXz-YG6zbkCFUdgMgodLDQAFQ

But should be able to hook that up and talk to it from IOS or Android me thinkst.

It sure would be good to get it to mesh with an Ipad for the viewing creen and portability prospects. However, a cheap used Android phone with no service can act as the interface. I just like the Ipad due to the nice large screen size.

Subject: Re: [baofeng_uv5r] APRS News

Here is a really stupid question.. Would you be able to bypass spp and use map? Supposedly ios supports the profile, and from developer.bluetooth.org:

The main scenarios covered by this profile:

* Notifying a remote device of the arrival of a new message on a
messaging device.
* Browsing messages in a messaging device.
* Uploading messages onto a messaging device.
* Deleting messages onto a messaging device.
* Sending messages through a remote device.

I am not an apple developer, so no clue if it would work or not, but
"sending messages" and "notifying a remote device" look like they could
potentially handle everything needed, at least for aprs usage.

btw, have been keeping an eye on your dev work of the mobilinkd, when i have
some spare cash, will be ordering one, looks to be a decent little system
for the price. I was playing around with BertOS for a bit, looks to be
relatively robust with minimal overhead.

wrote:

Sounds great! APRSIS32 works well. It has decent KISS support.

I was a rather disappointed when I discovered that the Bluetooth module
would not work with an iPhone. It seems that this was done to make add-ons
to the iPhone impossible without paying a tax to Apple. Instead Apple makes
product developers buy Apple-specific "MFi" modules. Grrr...

There are inexpensive Android tablets available with GPS and Bluetooth; the
Nexus 7 is a beautiful tablet that can be found for under $200. Some of
the Chinese Android phones and tablets -- perfectly appropriate with a
Baofeng radio -- can be had around the $100 mark. APRSdroid is great now
that it has OSM downloadable map support. There is no need to have a mobile
or wifi connection. When I have some free time I need to see if I can find
some topo maps for back-country hikes.

One of the things I need to start offering is a Bluetooth module for PCs and
laptops that don't have built-in BT support. I am still trying to find the
right one to sell. I'm mostly a Linux guy. Some of the cheaper BT modules
work OK with Windows but did not play nice with Linux. The ones that
worked out of the box were quite a bit more expensive. That said, I have an
old cheap one plugged in right now that used to crash the computer quickly.
Support seems to have improved.

wrote:

We just unloaded our Android phones for IPhones when we switched service
providers. The concept is a good one because this will eliminate the
cabling aspect, I might just get one to experiment using Aprsis32 on a
laptop.

If it works out I will use this as a demo for some of our trade shows that
we do here in SCali and in Vegas. I will try to get ahold of a Android
phone as the bluetooth function and portability is a really good concept
compared to a demo using just a laptop. I will direct potential customers

to your website as I am sure this will generate some interest especially at the electronic Ham shows we do.

Also it will be good to show the capabilities of a HT only interface to our young Pathfinder's groups.

Good deal.

Hi,

For general ax25 you might find the tt4 suites your needs better.

This was designed for APRS with HTs -- to get rid of the power cable, the GPS cable and the serial/USB cable that make interfacing a TNC to a HT a real hassle, and to give the user a rich user interface available on modern smart phone.

Cheers,

Rob

trying to compare this with the tnytrack4 witch i know will do ip over a.x.25

On Thu, Sep 12, 2013 at 10:37 PM, Colorado Rob <colorado.rob@...> wrote:

You may have problems because of the small buffers. I've not tried it. The MCU has very little RAM; the buffers are sized to hold a UI frame, but not bigger. For IP, the MTU will have to be rather small. And the UV-5R would not be the radio of choice for that application either. The duty cycle is typically too high.

That said, I'd love to see people experimenting with this sort of stuff.

wrote:

Hi Everyone,

Folks that have followed along with my APRS adventures building a TNC know that they started here on this Baofeng UV-5R group. The first prototypes using an Arduino and a breadboard are documented in the APRS photos section <http://groups.yahoo.com/group/baofeng_uv5r/photos/album/890131112/pic/list> . What started out with a Bluetooth board, an Arduino, a UV-5R and an Android phone is now a real product.

If anyone wants to play along with APRS on the UV-5R, you can find them here: http://www.mobilinkd.com/.

This is a battery-powered, Bluetooth TNC that connects to the radio. The TNC talks to APRSdroid <https://play.google.com/store/apps/details?id=org.aprsdroid.app> on Android (or Xastir on Linux, or APRSIS32 on Windows) via Bluetooth. The UV-5R with the 3800mAh battery is the perfect companion* as they will both last about 48 hours on a full charge. It is a KISS TNC that is designed for APRS. It is designed for use with HT's, but I have one running on a mobile rig as a local digipeater too.

* Those that know me also know that I live in an area where the UV-5R does not perform well on VHF. I have to drive a good ways away from the city before I can hear much on VHF. But if you don't have these problems in your area, you should find that the UV-5R works well for APRS. Also, some digipeaters have rather short TX Delay (the time between when it starts sending the carrier and starts sending data). The UV-5R is rather slow to open its squelch and can miss these packets.

The Baofeng is by no means a perfect radio for APRS -- but for under $50, it's a great radio to get started with APRS. And we've managed to keep the price of the TNC under $50 as well. If APRS is something you have always wanted to play around with, this TNC <http://mobilinkd.myshopify.com/products/bluetooth-kiss-tnc> is the perfect accessory for your radio. The TNC is very small and easily attaches to any HT with a rubber band or velcro strips.

This weekend only -- for members of this list -- enter coupon code UV5R and get $5 off the UV-5R cable <http://mobilinkd.myshopify.com/products/kenwood-wouxun-baofeng-tnc-cable> .

And, if you are interested in hacking the TNC, the firmware and the configuration program (written in Python; works on Linux and Windows) are open source and hosted on Github. These and the Android app (which will be on Github soon) are a work in progress but are functional for getting the volume properly adjusted.

I'm happy to answer any questions (probably best off-list unless they are of general interest to UV-5R owners). There is a Yahoo group <http://groups.yahoo.com/group/mobilinkd/> set up for this TNC if you'd

like to discuss the TNC with others.

Cheers!

Rob

You have nailed down the problem with Amazon.? You are not always dealing with Amazon, if fact most of the time Amazon is just a pass through and if you are not careful you don't know who you are actually buying from.

I trust Three Old Crows to have the product I want.? I just bought a new cable from him.? He had a choice of three, with good information about which one was best for my use.?

By the way.? I destroyed a very cheap prolific clone cable by removing it from a radio with the radio still turned on.? I can think of nothing else I did wrong, but after that act the cable no longer worked.? It was fine before and dead after.

I tried it on four different computers that it had previously work on.? Two XP boxes a Vista? and one Windows 7.

That was the first time I had seen it mentioned that removing a cable from a radio with the radio on killed a cable.? My guess is that the very cheap clone had no protection circuit, or it was just time for it to die? ;-(

Every time I tried to roll my own they leak all over me and my printer. Might be me. Might be the system I used.

I buy only HP printers and ink. (I do not work for HP)

Craig Carnahan wrote:

Bob,

The cable problem (on Amazon, e-Bay, etc.) is normally due to sellers there dropping their prices over and over until their profits are coming more from the shipping fees vs. the actual hardware, and then some even go farther by offering free shipping, so the only way for them to stay in business is by selling the fake Prolific chipped cables to hit the Amazon or e-Bay price points. Even then, 99% of those fake cables "can" work, it's normally the end-user's that don't understand that the fake Prolific cables take a few extra steps to get working.

Kurt at TOC sells a higher cost (but genuine Prolific or FTDI cable), so naturally his cables work with far fewer problems reported, but to be fair, you'd expect a $20.00 cable to work better than a $3.00 cable no matter who sells it. The problem that Amazon, e-Bay and others have is that they are totally unprepared in separating "fake" vs. real "genuine" cables, and none of their suppliers is going to tell them their $3.00 cables are using fake chip-sets, they simply want the "Buy-Box" on Amazon or e-Bay.

I could make a new listing on Amazon or e-Bay tomorrow and put in the description "Real" or "Genuine" and three things would happen:

One, it would not stop anyone else from listing a clone cable at a cheaper price within my ad, and

Two, most new buyers would immediately buy the "cheaper" cable from a competitor in my listing and never know they were getting the "cloned" cable, and

Three, if those users searched Amazon or e-Bay a little further, they would find even cheaper cables listed for sale and assume they are the same, after all they look the same and again NO sellers list (within their ad) that their cables are the cheap clone cables that require a little extra to get the driver to work properly.

To be fair, Amazon and e-Bay have the same issue with many other non-serialized products. Just try buying a "real" HP toner cartridge and half the time you'll get either a cheap re-fill (that was advertized as new in box) or you'll get a generic toner in generic box.

I disagree, I bought my cable from amazon and had no problems at all.

On Sat, Sep 14, 2013 at 12:00 PM, Bob Holmes <keystone_kid16@...> wrote:

George,

You know what is sad here is that the transaction in general makes Amazon look bad and they actually have no knowledge that the vendor has a supply of poorly made cables being sold all over the map. Same scenario goes for Ebay. It all falls on the shoulders of the vendor in any case. Finally, the best place to buy, as you mentioned, is from Kurt at Three Old Crows.

Yes I made the mistake of ordering one from Amazon. (Programming cable that is). Fortunately Amazon gave me no hassles in returning it. Most likely I will be placing an order today for one from three old crows in Texas. I'd like to thank all the members in the group for helping me in this matter.

I have absolutely no problem with Amazon at all. I order my radios and cables through them and have never had a problem. If the ad says its Ships from and Sold by Amazon.com, you get it delivered quickly and if there's a problem, you send it back to their US warehouse for immediate replacement or refund, not China. The radios I have gotten have always been the latest firmware with excellent service.

My 2 cents. HV

Every HP color printer or color printer/scanner/copier I've ever had
came with the crappiest software known to man. On more than one occasion
the software had problems communicating with the printer, or stopped
working altogether and nothing I tried would make everything play nice
again. After the last HP color printer fiasco, I bought an Epson. It
works flawlessly and I couldn't be any happier with my choice.

The only HP printer I will ever buy again is one of their non-color
LaserJets, one of which I currently have. It, too, works great.

I like Epson R300/200 and all the variants because they can print on printable CD, DVD, and BluRay discs. In do like HP and cannons for other tasks. If you want cheap ink but cartridges on eBay. If you want something yo do not have to fiddle with get CIS (Continuous Ink System). Basically special ink cartridges with tubes that connect to ink tanks. Then internal cartridge chips reset to full whenever they get low. I wore out a printer before using up all the ink.:-). They are very inexpensive and about the cheapest long term solution. If the ink tanks ever run low you can buy ink to refill them. Imagine buy 8 to 16 oz bottles of ink for less than the cost of one cartridge. One cartridge that holds a tiny fraction of an ounce vs 8 to 16 ounces. Gee let me think??? :-). Just make sure you get the same type of ink for the same results. There is dye ink, pigmented ink and other specialize inks. Just read the descriptions or contact the seller if you're not sure.

I print to an IP address. HP toners cost too much.
A 3rd party cartridge is cheaper and fuller.

In love Epson's too but even Epson printers have their quirks. Every so often I have to do a special reset on the ink tank full register. The printer just stops working with an error. If you call Epson they will tell you to buy a new printer or send it back to Epson for repair that will cost much more than a new printer. A simple reset has it running again. Waste ink is collected in a reservoir that might get full but in reality it mostly dries out. Some people mod the printer by taking the drain tube and redirecting it to a waste tank they install on the back. Some people take any black and color ink that ends up in the jar/external waste tank and add it to black ink they use for refilling or the black CIS ink. Its all about planned obsolescence and screwing you under the guise of making sure you have the best quality prints. :-) yeah sure. lol

Also Epson ink heads are part of the printer and on occasion I need to remove them for cleaning. If you let an Epson printer sit too long without printing the ink in the heads will dry up and clog the head. In that case you need special cleaning fluid to clear and dissolve the dried ink. I hear in really stubborn cases 409 cleaner works. But you will likely need to take the head out for proper cleaning.

I'm very handy so its just simple maintenance for me to own a printer that keeps going and going like the energizer bunny. One R200 I have still works although the head is so worn the printing isn't quite as clear as it should be. I keep that one as a backup to my backup. I also no longer buy them as I can find broken, clogged, and resettable printers that people throw out for little to nothing. :-). If you don't print on discs then I would say cannon and HP are good choices. Of course every manufacture has its lemons and crappy models.

34021. Re: [baofeng_uv5r] HP Printers

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 17:56:58 UTC
From: Paul Nourse
Topic: 34017 Message: 34021

I have a color laser printer that ran out of toner. Buying new toner will cost more than the printer but will be full instead of half full. I want to buy a color laser printer that has inexpensive toner cartridges. But seeing as my ink jets suffice for pretty much everything I haven't been sufficiently motivated to do the homework. Beside one of my sons that still live at home has a plaster printer of that description. He bought it off of Craig's list and if I want something printer with a laser jet incan just send the print job to his printer.
:-) anyone still have/use a dot matrix printer? Remember the noise. :-)

You have nailed down the problem with Amazon. You are not always dealing with Amazon, if fact most of the time Amazon is just a pass through and if you are not careful you don't know who you are actually buying from.

I trust Three Old Crows to have the product I want. I just bought a new cable from him. He had a choice of three, with good information about which one was best for my use.

By the way. I destroyed a very cheap prolific clone cable by removing it from a radio with the radio still turned on. I can think of nothing else I did wrong, but after that act the cable no longer worked. It was fine before and dead after.

I tried it on four different computers that it had previously work on. Two XP boxes a Vista and one Windows 7.

That was the first time I had seen it mentioned that removing a cable from a radio with the radio on killed a cable. My guess is that the very cheap clone had no protection circuit, or it was just time for it to die ;-(

Yes I made the mistake of ordering one from Amazon. (Programming cable that is). Fortunately Amazon gave me no hassles in returning it. Most likely I will be placing an order today for one from three old crows in Texas. I'd like to thank all the members in the group for helping me in this matter.

Printer companies stole their business model from dope dealers.

They’ll almost give you the printer to hook you into paying outrageous prices for ink.

Genuine isn't always better. In the case of the Baofeng cable it is, sure. As far as ink and toner your usually way better off going generic. For my inkjet printers buy genuine is a guaranteed to be ripped off. Buy enough ink cartridges til you have a gallon of ink and it will cost you way more than a thousand dollars. Ink does not cost anywhere near that price. The manufacturers make no money on the actual printer. They make profit on the ink. The Baofeng radios are proof bargains exist

Excellent idea. :-). Someone asks a question, you send a fat cut and paste or a piece of the whole. If you are tired of answering the same questions then stop answering them! No one is making you answer anything. Another Ham brother will pick up the slack. Or sister. :-)

Sometimes people just want to start playing with their new toy right away. Digging through posts or reading the f-ing manual may be too much to bare. So what. Really. Oh they are lazy, OK. What's your point other than they are not you? Different strokes for different folks. And like I said you do not have to answer anything. You can even skip messages.

Wow its the information age. Who knew! ;-) lol

There were files in this group that were unavailable via the new interface.
Nothing in a folder with an "&" symbol could be accessed. A simple edit of
the folder names expanding all "&" symbols to the word "and" made
everything available again.

*Genuine isn't always better. In the case of the Baofeng cable it is,

*
It's true that "sometimes" buying generic won't screw you up, but the
sayings "you get what you pay for" and "buyer beware" are well-earned
warnings for most folks. I could site multiple examples of many large IT
customers that ended up spending far more overall after their Purchasing
departments tried various short cuts (to get costs down by using generics),
but this is a Baofeng forum so I'll stick to the subject at hand.

Any product purchased is only a "bargain" (including Baofeng radios) if it
works as advertized. Can't comment specifically about Amazon direct sales,
but you can be fairly sure that the third-party merchants selling at Amazon
don't box up their returns and ship the product back to China if the
customer returns it. To be fair, many radios returned fall under the
problem of the customer simply not knowing how to do something as simple as
programming the radio (and the radio hardware itself is fine), or the
customer expects Motorola APX7000 performance from an under $100 radio (and
again the radio itself is fine and performs to it's actual specs, just not
what the customer wants in their "bargain" radio).

Just remember it's not generally the manufacturer making the "bargain"
products that invests in R&D (which eventually introduces some new "must
have" gadget or feature), it's the market leaders in their fields. The
"bargain" manufacturers (in most cases located in China where strange ideas
like patents are just ignored) simply churn out cheaply made versions (or
in some cases direct copies) of another manufacturer's work. If the
products they produce work "well enough" to ignore any issues that product
has, it's a "bargain" to those of us looking for those type of products,
but many folks really need the support and better quality the OEM product
manufacturer provides.

It was the HP color ink jet printers (both regular printers and Printer/Scanner/Copiers), that I had so much trouble with. I should have been a little more clear.

I've never owned a color LaserJet and have no experience with them.

My experience with 3rd party toner cartridges has been lousy print
quality and shorter life than a genuine HP standard cartridge.

I buy the high capacity HP brand cartridge for my LaserJet 1320. It
costs about 50% more than the standard cartridge, but has 2-1/2 times
the capacity (number of pages). Always great print quality, too.

I buy from a real retailer via their website rather than take a chance
on an eBay or Amazon headache.

34032. Monitoring one band and scanning the other

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 20:49:41 UTC
From: <jtovet@...>
Topic: 34032 Message: 34032

I'm sure it's me...screwing up somewhere here. I just programmed in 10 repeaters and 8 public service frequencies.

I then setup all of the repeaters to skip (S).

I figure this way I can scan the public service on one band while on the other band I "sit" on my local repeater (no scan)

So here's what happens. Let's say my local repeater is on band B. I jump over to band A and start scanning the police and fire.

If someone calls me on Band B my local repeater which is not scanning I can't hear him.

It seems that I can only hear from the band that I am "sitting" on.

Shouldn't I be able to hear band Band while scanning Band A?

Any help is truly appreciated.

Larry,

I doubt that removing the programming cable from the radio with the power on caused it to fail. I have done that hundreds of times here with multiple programming cables and multiple radios.

Early in the history of this group, someone uploaded a picture of the USB end of a programming cable that had the plastic shell removed after it has failed. It showed how frayed the wires were and how poorly they were soldered to the circuit board. The failure was probably due to a short from the frayed wires contacting each other or and open from one or more of the wires not making contact with the circuit board or both. Unfortunately, the picture doesn't appear to be available any more.

It is more likely that poor construction was the failure mode of your cable than from being removed from the radio while it was powered on. That's part of the reason that we can buy them so cheaply. Unfortunately, paying more

for a programming cable, does not guarantee that it was made any better.

So far I've been lucky with my programming cable purchases. They all have worked fine.

409shop - Prolific (unauthorized)
dealextreme - Prolific (unauthorized)
eShow (eBay) 6-in-1 cable set - Prolific (genuine)
Three Crows General Store - Prolific (genuine)
Three Crows General Store - FTDI

Anyone who has recently gotten the Baofeng UV-5R in the upgraded version which antenna did you get? The original stock antenna that came with the Baofeng UV-5R or did they upgrade that on the revision with the extended battery?

Just curious as mine won't be here until end of the next week.

Jokes on you. Why take your toys home when you could contribute to the group. Or is contributing for just those the stray off topic from time to time?

As fad as the UV5R I had no problem programing it right out of the box. Not too much different than my old Yeasu FT-209. After my exam I'll use chirp and see how that goes.

I also bought a UVB5. The wife is going to take the tech exam. If she can remember her electronics and IT background she should pass.

I have a feeling I'll be spending much more money on radios in the near future. :-)

> It appears to be scanning frequencies, not DCS codes.
> Same thing happens for a CTCSS scan.
> Any ideas?

I'm going to get slammed for telling you this, but the problem is that you are NOT following the instructions.

You have to be receiving the signal in VFO mode AND you have to put the radio into CTCSS (or DCS) entry mode. You apparently are getting the radio out of tone entry mode and back into its regular receiving mode (which is why you see frequencies on the screen, not tones).

These radios can be a little touchy and you do have to HOLD the *SCAN button for several seconds before it will start scanning for tones. If you release the button even slightly the radio will drop out of the menu and back into its regular receiving mode.

> I disagree, I bought my cable from amazon and had no problems at all.

It makes very little difference where anyone buys their programming cable, IF they are able to read and follow the instructions available on the Miklor website.

For those who cannot or will not read and follow directions, then it does become important what kind of USB-to-Serial chip their programming cable uses.

Three Old Crows offers just about the cheapest programming cable that works correctly with the drivers that Windows will load automatically. This eliminates the need to read and follow the directions about how to manually load the drivers that work regardless of whether the cable has a clone or a genuine Prolific chip. Since the cost of the cable from T.O.C. is barely more than the cost of a random cable from the cheapest source in China -- and will arrive more quickly -- it generally makes sense to buy the cable from them.

34049. Re: [baofeng_uv5r] Monitoring one band and scanning the other

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-15 21:05:23 UTC
From: Xaun Loc
Topic: 34032 Message: 34049

The problem isn’t anything you are doing wrong – the problem is that the radio CANNOT do what you are trying to do.

This radio does NOT have two receivers in it. It has one receiver and one transmitter. The two displays are just displays. You can switch between which display controls the receiver, but only one display is actually connected to the receiver at any time.

When the radio is in dual watch, it scans back and forth between the frequency in the A display and the frequency in the B display, with each display alternately controlling the receiver.

BUT if you put either display into scan mode, that display takes control of the receiver to scan the memory channels. The other display is no longer involved.

You can dual watch or you can memory scan or you can frequency scan, but you can only do one of those at any time.

From: jtovet@...

I'm sure it's me...screwing up somewhere here. I just programmed in 10 repeaters and 8 public service frequencies.

I then setup all of the repeaters to skip (S).

I figure this way I can scan the public service on one band while on the other band I "sit" on my local repeater (no scan)

So here's what happens. Let's say my local repeater is on band B. I jump over to band A and start scanning the police and fire.

If someone calls me on Band B my local repeater which is not scanning I can't hear him.

It seems that I can only hear from the band that I am "sitting" on.

Shouldn't I be able to hear band Band while scanning Band A?

Any help is truly appreciated.

Jim W1JT

34051. Hard Reset on UV-5R, (No TX or RX) ???

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-16 00:55:31 UTC
From: rjohnson
Topic: 34051 Message: 34051

I went on vacation and left my UV-5R turned on the kitchen counter.
When I returned the thing was completely dead.
I put it on the charger and left it overnight but it doesn't work any more !!!

Most of my MENU settings are what I had programmed.

But I Have no RX/TX capability any more, NADA

I looked thru the manual for a "Hard Reset" procedure and found nothing.

Has anyone had a problem like this and what's the cure.

There is no such thing as a "hard" or "factory" reset for the UV-5R. Check the voltage on your battery. The UV-5R is known to inhibit TX if the voltage is too high.

If somehow the memory of your radio got corrupted by letting the battery go dead, I doubt it, you could restore it by uploading a saved CHIRP image if you happen to use CHIRP.

If you don't use CHIRP, then get it and install it. Download/read from the radio to find out what your firmware version is. Then download the "reset" file that matches your firmware version from here.

http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/

Upload/write the "reset" image to your radio. That will restore any corrupt memory. If that recovers your radio, then you should be able to reprogram your radio with whatever software you were using before.

Thank you!

Your explanation makes perfect sense.

I'm glad I only paid $45 for this radio..

For what it is it does an OK job.

thanks again
Jim

If you don't get the upgraded version, I just bought the upgraded antenna that comes on the UV-B5/B6 from an eBay vendor for $4.98 after seeing the antenna mentioned on Hans' blog.

The dealer I'm getting my radio from is back east in New Jersey, I'm seeing according to my tracking page the radio should be here by Weds, so, we'll see what they put in the box, I'm looking forward to getting my stinky hands on it.

I went on vacation and left my UV-5R turned on the kitchen counter.
When I returned the thing was completely dead.
I put it on the charger and left it overnight but it doesn't work any more !!!

Most of my MENU settings are what I had programmed.

But I Have no RX/TX capability any more, NADA

I looked thru the manual for a "Hard Reset" procedure and found nothing.

Has anyone had a problem like this and what's the cure.

Information found at :
http://lwra.us/?page_id=2872
(Lake Wales Radio Amateurs' web site) <http://lwra.us>

Reseting the UV-5R:
==========

Switch on the UV-5R, press the Menu button, type '40', and press the
Menu button again. The display will show "Reset All". Press Menu again.
The display will show "Source?" Press the Menu button once more to
confirm your choice. Do this quickly, you have only once second or so.
All that weird factory memory data is deleted now, and defaults are
restored.

34064. Baofeng to Icom Headset Adapter?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-16 09:49:31 UTC
From: Brian
Topic: 34064 Message: 34064

Hi Guys

Quick intro (as this is my first post here): ...

Name Brian Tunnard
Use of coms: mainly pilot to pilot short range coms (typical 5kms)
whilst flying a Paramotor (Powered Paraglider or PPG).

So here's the QUESTION (re: Baofeng UV5R, to Icom 2 pin type headset
adapter): ...

Is there such an adapter 'already made' for us to buy (I've searched
for a couple of days already without success [:-s]) ... OR ... "can
any of U 'sparkies/Hams' make us a couple? Most of us have the Icom
type 2 pin headsets, so this will be needed to connect our existing
headsets if more of us get the Baofeng UV5R radios (could be a few of
us ;-)) ...

Here's what we're talking about (I think [/:)]): ...

[photo
Kenwood_Puxing_BaofengtoIcomcopatibleheadsetadapter_zps68eda824.jpg]
<http://s746.photobucket.com/user/dovecotecomputers/media/Kenwood_Puxing\
_BaofengtoIcomcopatibleheadsetadapter_zps68eda824.jpg.html>

Any help or advice you can give us, where we can source these would be
gratefully received ... or failing that ... if someone who solders
better than I can would be willing to make us one (or two), THAT would
be even better [:p] . We will of course pay (a modest sum [:))])

Thanks in Advance Guys

Hi Jeff.

My new uv-5r+ came with antenna that is 17.5cm long. The seller described it as new and improved.

What length is the standard one?

Cheers

The radio is shipped from the factory with whatever the buyer asks for…if they don't ask they'll get whatever is cheapest/available which tends to change with the model. If you've ever seen how these factories work production managers will be loath to change antennas unless told to (you rely heavily on existing product pipelines to support production without a lot of depth of stock).

I did confirm this with Baofeng.

There is no "standard" per se. You get what you pay for and a specific model will most likely have a common antenna since most buyers want the cheapest.

Just look at all the antennas on their website:

http://www.baofengradio.com/en/product.asp?BigClassName=Accessories <http://www.baofengradio.com/en/product.asp?BigClassName=Accessories&Smallclassname=Antenna>
&Smallclassname=Antenna

The verbiage with each antenna shows the radios its most associated with.

The "newer" antenna I have appears to be the A-V85 (came with a BF-F9 from threeoldcrows) but without markings I hesitate to say that with 100% surety.

http://www.baofengradio.com/en/ProShowcn.asp?ID=219

And my testing shows the A-V85 antenna to be worse at 146MHz then the shorter ducky which appears to be the A-5R logo…not by a lot…maybe 1 or 2 dB

So beware of "newer" antennas.

I just received my uv-5r Friday from radioshop888. The antenna on it was 4 3/4 inches long. I had no trouble hitting the repeater 20 miles away. It was very easy to load the memories using Chirp. I had trouble using the Baofeng software until I went back a revision on the usb drivers (miklor.com has directions). I would stick with Chirp. I also have a kenwood TH-F6 and all my accessories including the programing cable worked with the UV-5R.

Topic: 34073 Message: 34073

I'm having issues using the genuine usb cable that came with my UV-5R for programming my BF-666s. Some sellers list it for both transcievers. I tried it with the BF480 software from the powerphone/baofeng website and set the 400-470Mhz width in the software along with the correct com-port, but nothing happens when I try to read or write to the radio.

The cable works fine with my UV-5R.

Sorry for the inconvenience since this is a UV-xx dedicated group. Thanks in advance :)

Following up from Michaels post, I've had a look on the Baofeng website and I do appear to have the Antenna (A-V85).

Just waiting for my adapter to arrive so I can hook up my diamond X-50 !

Rupert

--- In baofeng_uv5r@yahoogroups.com, <lfotto@...> wrote:

I just received my uv-5r Friday from radioshop888. The antenna on it was 4 3/4 inches long. I had no trouble hitting the repeater 20 miles away. It was very easy to load the memories using Chirp. I had trouble using the Baofeng software until I went back a revision on the usb drivers (miklor.com has directions). I would stick with Chirp. I also have a kenwood TH-F6 and all my accessories including the programing cable worked with the UV-5R.

Rupert,

I'm not sure what the standard length is on the stock antenna, but I have seen a few YouTube video of several people getting the newer antenna with the radio over the original stock antenna. I will let everyone one once it gets here.

Hi Jeff.

My new uv-5r+ came with antenna that is 17.5cm long. The seller described it as new and improved.

What length is the standard one?

Cheers

Rupert G7SPE

A somewhat hokey workaround that was discussed once (but I haven't tried it), is to program multiple copies of your priority channel, so it gets scanned more frequently. ie:

Channel 0 - Town A fire
Channel 1 - Priority channel (my favorite repeater)
Channel 2 - Town A police
Channel 3 - Priority channel (my favorite repeater)
Channel 4 - Town B fire
Channel 5 - Priority channel (my favorite repeater)
Channel 6 - Town B police
Channel 7 - Priority channel (my favorite repeater)
Channel 8 - Town C fire
Channel 9 - Priority channel (my favorite repeater)
Channel 10 - Town C police
Channel 11 - Priority channel (my favorite repeater)
Channel 12 - Town D fire
Channel 13 - Priority channel (my favorite repeater)
Channel 14 - Town D police
Channel 15 - Priority channel (my favorite repeater)

You could even interleave multiple priority channels (ie alternate 2 repeaters)

Hello does anybody know were information can be had as to what voltage and if an adapter is avaible to plug in the jack at the top of this battery , I always use the house charger but would like to charge in car if needed. I use the 3800mah battery all the time , and also want a case that can hold the radio with the big battery on it.
Thanks ahead of time for any information.

Well, since it is actually a charging socket for a 2C 3800mAh Li-Ion battery pack I don't think just a voltage requirement is the only thing one should look at. Charging a Li-Ion battery should be done only using an appropriate charger for safety and battery life. The 3800mAh battery does not contain any of the appropriate circuitry for charging, so I would only recommend plugging in an appropriate charger to the charging socket.

I would recommend looking at the following web sites for details about charging Li-Ion batteries.

That schematic would appear adequate to covert the "el cheapo" Baofeng
to an "el cheapo" Icom style microphone/headset but I think you need to
give us a little more information on the headsets you are using.
Aviation headsets have different impedances that require matching.

Jim,

I'm pretty sure that this question has already been answered, but just in case, the radio can not do what you want it to do. Once you start scanning in one VFO that's it, nothing on the second VFO will be heard. Your dual band receive option is really just one receiver that jumps from VFO A to VFO B back and forth (like a scanner), so when you start scanning on either VFO that's all the radio can do.

34091. Hard Reset on UV-5R, (No TX or RX) ???

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-16 23:56:30 UTC
From: rjohnson
Topic: 34051 Message: 34091

I went on vacation and left my UV-5R turned on the kitchen counter.
When I returned the thing was completely dead.
I put it on the charger and left it overnight but it doesn't work any more !!!

Most of my MENU settings are what I had programmed.

But I Have no RX/TX capability any more, NADA

I looked thru the manual for a "Hard Reset" procedure and found nothing.

Has anyone had a problem like this and what's the cure.

It's the Lithium battery. They often will not accept a charge once totally discharged.

Well, the radio finally came in today - So, it's now safe and sound in my hands. Looks like I ended up with the STOCK Antenna on this round out, so, I will see how well it works after it charges for the first time, than, I'll start playing with the programming and all tomorrow.

Overall the radio is nice small and fits well in my hand, which is good news with the extended battery.

More later -

Jeff - KE7OUR

The UV-5R shuts off when voltage gets too low so it does not totally discharge the battery.

And he said his menus were working….which means he has power….so the battery is not dead.

Menu 40 is their reset…

You should measure the voltage on the battery…ideally it should be around 8.4V when fully charged. Much over that and the battery would be overcharged.

If it’s more than that your charger may be defective. I’ve adjusted my TYT charger to stop at ~8.37V when done.

34097. HDTV antenna for 5R

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-17 14:26:48 UTC
From: <toshutrinity@...>
Topic: 34097 Message: 34097

Guys,

I have a fancy OTA HDTV antenna that is not used with my TV any more. I was wondering whether it might enhance performance of the 5R if hooked up, since it is in the top of the third floor!!!???

Has anyone done this??

Any idea where I might get the correct adaptor??

Now you've opened a can of worms. Chances are it will not work at all. It is possible it may work on 70 cm. Odds are slim. If you can borrow an antenna analyzer you will be able to check resonance on the antenna.

I could have answered this way: "Sure! It will work for a few minutes, then your radio will will die and you will need new finals."

BTW What is the make and model of the antenna? It could be possible to mod it.

"To err is human, To really screw up requires a computer"

I never would’ve even though to try that.
Your antenna is a receiving antenna…not designed for transmit which means resonant frequencies don't matter in it's design.
It’s 75 Ohms instead of 50 but you can match that easy enough:
http://www.ham-radio.com/k6sti/match.htm
And it probably has a very low wattage rating....double check the specs....which you may well exceed.
Plus it's probably directional isn't it?
Might work great for reception…but I’ve never heard of anybody using one to transmit (not that I’ve had my license that long but with all my research on antennas I’ve been doing haven’t run across this idea yet)...

It might well have a very high SWR making it completely useless for transmit.

Just put a PL-259 on it and use a PL-259 to SMA-F adapter. And hopefully you have an antenna tester before you abuse your radio with it....you could damage the radio.

Probably not a good idea -

Most TV antennas are horizontally polarized while ham antennas are vertically polarized. The loss of signal caused by this mismatch is significant;

Depending on the age of the antenna installation, the TV lead is no doubt either 300 ohm or 72 ohm impedance. Your radio is looking for 50 ohms. Again, this mismatch is a signal killer - even more so if the distance to the antenna is greater than say 50 feet or so and especially when transmitting.

As has been noted already, the HDTV TV antenna is likely tuned to UHF frequencies (470 MHz to 700 MHz - assuming USA). Your radio works at VHF (136-174) and lower UHF (nominally 420-470).

Bottom line... it's not likely to help you. Your receiver may not complain too much but you might well damage your transmitter.

The antenna thats up there looks alot like this one and has a rotor that is currently frozen in place from lack of use.

http://www.channelmaster.com/METROtenna_with_J_Mount_CM_4220MHD_s/45.htm

I was planning on taking it down since the wind ds here have moved it off kilter and the rotor is stuck.

Take it down and replace it with a decent dipole.

One of the X series dual banders for example:

http://www.diamondantenna.net/Product_Catalog/base_station.html

I can’t even imagine what the antenna pattern must be on that thing.

Note: you don’t even need an antenna on your UV-5R to receive – I can hear my repeater and police dept just fine with no antenna at all.

I wouldn’t dare transmit without antenna though.

Hi Bill (Guys)

I've got two headsets ... one is an old Peltor with boom mike on a goosneck, and push to talk, all on left earcup (numbers worn off, so don't know model), the other is built into a Chinese 'Speed-Air' Helmet (similar gooseneck mike and two push to talks, one on each side).

Soz' to be a thicky, but I've got no idea of the impedance of either headset (I'm not a 'sparkie') ... but what I CAN say, is that they both work fine with my current (even cheaper [;;)]) tranceiver, a PMR Cobra Microtalk (with Icom 2 pin type plugs) and also with my old airband tranceiver, an Icom IC-A20.

Does this help?

Cheers

Brian

You mean more like 25kHz per channel (what we call wide band)? That□s the
amateur channel bandwidth.
Non-ham freqs are now 12.5kHz (what we call narrow band).

Or you looking for something else? Can you be more specific? Like FM
broadcast spacing or such?

Ed

I am looking for a thread that was started by Mike about his antenna testing. He had about 6-8 different antennas that he was testing on the 5R and had provided some initial results before I left town.

Tnx

Could you share the details of the exact components tested and used here. This sounds very interesting!!!!!!

kc3bcw

--- In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

There are 3 different versions of the antenna out now as the latest BFBS311 versions came with a new looking one.

1. Std rubber ducky most of us have seen

2. A longer version with a tapered end (often was the one to come with the camo versions)

3. The latest showing up in the 311's is a longer version (like number two above) but with a cylinder shaped end.

After looking at hundreds of these as we run Tech classes and are purchasing equipment for the upcoming (next year) Pathfinder's International Jamboree we expect a couple of hundred to be used at the International Jamboree for the Southern California conference area. All properly licensed groups will be receiving one unit.

Kurt from Three Crows probably has seen other versions too. Another member stated it is whatever rolls out during the assembly line that is put in the package. I feel this is true as they have shown up in mixed batches. However, the chances of getting the longer versions is greater if the radio is another color other than Black.

Speaking of Antennas, we just got a version in that is longer than the 771 series that uses a thin whip extension for the last few inches and will be testing it. The gain as stated on the package is higher.

With the extension piece being thin and very flexible compared to the 771 series, this means the problems users had with the antenna poking them when carrying on a belt or clip is not an issue as you do not feel the antenna at all for comfort carry. Will advise later about this version.

Another item is UHF amps, someone tested in our group a 40W version that was connected to an SMA pigtail to PL259 to the AMP. From the Amp it ran into a power/swr meter and into a Slim Jim roll up antenna roof mounted. A spectrum analyzer was connected at the initial start to look at spectral purity. The whole setup is very portable.

the results were really good as follows:

Within the 10Mhz tuning step gain was a good 40Watts. A few mhz outside the 10 mhz area the 3db power points were evident. So the Amp is a very flat frequency response with a large drop off of attenuation outside the 10mhz step. This eliminates the concern others had that the UV5R would be a spurious noise and harmonics source outside the intended bands.

Spectral analysis confirmed any spurious noise or harmonic generation was down low enough to not be a major concern while looking at the response portion of the 10mhz tuned range.

VSWR readings were 1:1.5 at the highest level, generally VSWR seemed to be almost 1:1.

Repeaters more than 50-miles away could be reached. The unit is rated at 10amps and can be AC-DC power supply connected or car battery connected. A small portable easily carried 12 vdc battery could be used for short transmissions. This gives the whole setup an easy portability factor for hiking, camping or to be used in an emergency.

Therefore, this is a doable for those would have the need to do this, while I would use a dedicated mobile unit for a car setup. A backpack or bug-out bag portable capability is an option as the selection of the lightest battery source is the greatest concern. Even a portable Gel-cell that would provide 10a could be used with the uv5 set at H power. Add that with some type of solar charge ability to the battery source you would have a winner.

KK6CRP

BTW the amp tested was just over $100.

Subject: RE: Re: [baofeng_uv5r] RE: Antenna question?

I just received my uv-5r Friday from radioshop888. The antenna on it was 4 3/4 inches long. I had no trouble hitting the repeater 20 miles away. It was very easy to load the memories using Chirp. I had trouble using the Baofeng software until I went back a revision on the usb drivers (miklor.com has directions). I would stick with Chirp. I also have a kenwood TH-F6 and all my accessories including the programing cable worked with the UV-5R.

Hi Alfred

I followed your link, and it takes me to a page with some very nice PPG helmets, and a few coms & cables ... BUT ... unless I'm 'not seeing the wood for the trees', I can't spot an adapter (or cable) that has the 'male' Kenwood 2 pins at one end, and the 'female' Icom 2 pins sockets at the other end?

What have I missed?

Cheers

Brian

Mike,

I live in an HOA, so putting up an antenna like that is out of the question. I was thinking of putting up a J Pole that might blend in with the HDTV antenna.....apparently HOAs cant deny you the right to have an HDTV antenna...

--- In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

Take it down and replace it with a decent dipole.
One of the X series dual banders for example:
http://www.diamondantenna.net/Product_Catalog/base_station.html

I can’t even imagine what the antenna pattern must be on that thing.

Note: you don’t even need an antenna on your UV-5R to receive – I can hear my repeater and police dept just fine with no antenna at all.
I wouldn’t dare transmit without antenna though.

Probably not a good idea -

Most TV antennas are horizontally polarized while ham antennas are vertically polarized. The loss of signal caused by this mismatch is significant;

Depending on the age of the antenna installation, the TV lead is no doubt either 300 ohm or 72 ohm impedance. Your radio is looking for 50 ohms. Again, this mismatch is a signal killer - even more so if the distance to the antenna is greater than say 50 feet or so and especially when transmitting.

As has been noted already, the HDTV TV antenna is likely tuned to UHF frequencies (470 MHz to 700 MHz - assuming USA). Your radio works at VHF (136-174) and lower UHF (nominally 420-470).

Bottom line... it's not likely to help you. Your receiver may not complain too much but you might well damage your transmitter.

I love J-poles & Slim Jims, but from what I understand they tend to couple easily to nearby objects. So "blend in" might not work well for you if you're thinking of running it beside a mast or next to your HDTV. A copper one at the top of a mast would be best, but for your HOA.

I have a homemade 450 ohm ladder line Slim Jim hanging from the ceiling in my garage. (My roof is shallow so there wasn't room in the attic.) It works quite well. I shamelessly copied one I bought from N9TAX, who makes great antennas at a very reasonable price, so I highly recommend his work. I just wanted to make another one "for fun". (My original N9TAX antenna is a roll-up contingency job I keep with a "SHTF kit".)

You'll have to make a stink, but HOAs CANNOT restrict your ability to communicate via radio - HOA covenants do not trump US Federal laws. Sometimes you have to fight them on that, because they can still impose fines - even when they're in the wrong.

ARRL members have the benefit of an army of lawyers which will defend your right to communicate in the face of those pesky HOA teetotalers.

(Also, fishing line as antenna support is less visible, if that helps)

Actually, they (HOA Codes, covenants and restrictions) are specifically NOT covered by PRB-1, and it seems that the FCC, when asked to rule on this in the last year, chose to retain the status quo.

That one's in my collection now. At least it looks exactly the same as the $5.49 one on threeoldcrows website. So I'm calling it with that name right now.

http://threeoldcrows.com/shop/magento/ham-radio-equipment/antennas/generic-dual-band-antenna.html

I'll be testing these.note that there are some dups as some of these antennas had different packaging so I'm testing three NA-771's, two NA-701's.

There was some question as to whether the package color might tell you something about fakes.

When you moved into your commune (HOA) you signed a waiver to your rights by agreeing to the commune's CCR's and their HOA. I would personally never agree to give up my right to free speech (radio), but in your case the damage is done.

You could certainly fight them in court (and depending on your state's laws, the skill of your attorney, and the size of your wallet, you might even win, but the odds are long since you willingly gave up your "rights" by signing their paperwork, which is why so many ham's were hoping the FCC would put some federal muscle behind PRB-1).

Your best bet may be to get and use a hidden antenna, like a Ventenna (http://www.ventenna.com/).

The only thing that I have been able to come up with that I suspect will work for charging the extended capacity battery with the coaxial charging port is the car charging adapter that comes with the TYT TH-UVF9 radio. This battery is physically the same as the battery that goes on the UV-5R except instead of having the charging contacts on the back for a charging cradle, there is a coaxial charging port on the side. The radio comes with both a wall wart charger and a 12v automobile charger. I noticed that there is a picture in the group photos area that shows an extended capacity battery with one of these 12v auto chargers.

I have been looking for a vendor that sells the 12v automobile charger separately. For the longest time is seemed that the only way to get one was to buy the TYT radio. Yesterday, after reading your question, I did find one at dhgate.com but it is quite pricey.

From: Bill Maxwell
Topic: 34064 Message: 34132

On the strength of your experience, it looks like your headsets work
with both low impedance cheapy type radios and the higher impedance
airband type, so you shouldn't have a problem.

As you have probably worked out from the schematic in that link you
sent, the essential difference between the Icom standard and the Kenwood
standard that Baofeng and most chinese manufacturers use is that the
bigger plug is used for the microphone connection on the Baofeng but the
speaker on the Icom. The other significant difference is that Icom uses
a slightly wider spacing between the plugs than Baofeng.

$17 for a car charger is only "pricey" when comparing it to a $40 radio, if Motorola, Kenwood, or Icom sold the same unit it would easily cost 3 times that amount.

Wow, a mismatched 75ohm to 300ohm (instead of 50ohm) cable run of at least 40 feet on a horizonally polarized TV antenna (instead of vertical) cut for a different frequency (instead of 70cm) plus an adapter (or two?) to get it to fit a UV-5R and you honestly think that's going to get you "more" performance? Seriously? C'mon man. [?]

Jim,

Isn't that just a 12v power cord for the charging base? If my memory serves me correctly some of the TYT Radios shipped with both a wall wart and a 12v cigarette lighter power cord for powering the charging base.

Subject: RE: [baofeng_uv5r] Hard Reset on UV-5R, (No TX or RX) ???

The UV-5R shuts off when voltage gets too low so it does not totally discharge the battery.

And he said his menus were working….which means he has power….so the battery is not dead.

Menu 40 is their reset…

You should measure the voltage on the battery…ideally it should be around 8.4V when fully charged. Much over that and the battery would be overcharged.

If it’s more than that your charger may be defective. I’ve adjusted my TYT charger to stop at ~8.37V when done.

It's the Lithium battery. They often will not accept a charge once totally discharged.

Sent from my iPhone

On Sep 15, 2013, at 8:55 PM, rjohnson <k1vu@...> wrote:

I went on vacation and left my UV-5R turned on the kitchen counter.
When I returned the thing was completely dead.
I put it on the charger and left it overnight but it doesn't work any more !!!

Most of my MENU settings are what I had programmed.

But I Have no RX/TX capability any more, NADA

I looked thru the manual for a "Hard Reset" procedure and found nothing.

Has anyone had a problem like this and what's the cure.

You'll have to make a stink, but HOAs CANNOT restrict your ability to communicate via radio - HOA covenants do not trump US Federal laws.

Sometimes you have to fight them on that, because they can still impose fines - even when they're in the wrong.

ARRL members have the benefit of an army of lawyers which will defend your right to communicate in the face of those pesky HOA teetotalers.

(Also, fishing line as antenna support is less visible, if that helps)

Aren't you contradicting yourself. If the TYT charge cradle is happy running at 13.5v, it has to contain the Li-ion control circuit. Therefore it cannot be in the wall wart or the cigarette, I don't believe it has any Li-ion charging circuitry built in to it.

I am talking about 2 different radios

TYT TH-UVF8 - uses BCG-F8 charging cradle similar to UV-5R.

TYT TH-UVF9 - does not have charging cradle. Comes with wall wart and 12V auto adapter with charging circuitry built in because the battery has a coaxial charging port and NO CONTACTS for a charging cradle.

Hi,

It is probably my photo that shows this charger with the extended battery?

I also own a TYT TH-UVF9, which has the same battery as the UV5-R. The big differnce is that the TYT battery has no charging contacts and both wall wart and car charger connects to the charging port on the battery.

I can confirm that both these chargers for the TYT radio also charges the extended Baofeng battery. I use the 12V (rated also for 24V) car charger on a daily basis, and it works all OK.

Could use a stub match for the impedance but other than reception I don't think it will work very well. I've head of people modding TV antennas, rotating to vertical and having it work. Unmodified I'm thinking no way for transmission on 2 meter.

Impedance matching is easy. Having a resonant antenna that will get the rf out requires modding or finding a frequency the antenna likes which is probably not one you should be transmitting on. What the point if it doesn't send you RF into the air?

34157. PRB-1

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-18 02:57:59 UTC
From: ZIP-G
Topic: 34157 Message: 34157

FYI

HERE IS AN EXCERPT FROM THE ARRL'S PAGE:

With PRB-1, the FCC “established a policy of limited preemption of state and local regulations governing amateur station facilities, including antennas and support structures, but expressly decided not to extend its limited preemption policy to CC&Rs in home ownership deeds and condominium bylaws because ‘[s]uch agreements are voluntarily entered into by the buyer or tenant when the agreement is executed and do not usually concern the Commission.’ In 2001, the Commission denied a Petition requesting that the Commission adopt rules to preempt CC&Rs that do not provide reasonable accommodation for Amateur Radio operators, and affirmed that the limited preemption policy of PRB-1 applies only to state and local regulations. The Commission noted that its decision in PRB-1 to exclude CC&Rs from its preemption policy was premised upon the fundamental difference between state and local regulations, with which an Amateur Radio operator must comply, and CC&Rs, which are contractual terms to which the purchaser of a property voluntarily subjects him- or herself.” The FCC also concluded in its PRB-1 decision that “there ha[d] not been a sufficient showing that CC&Rs prevent Amateur Radio operators from pursuing the basis and purpose of the Amateur Service.”

SO IF YOU SIGNED A PAPER I THINK YOU ARE BOUND BY CONTRACT. ASK YOUR ATTORNEY.

Personally, I think every state should outlaw any private rule or
regulation that attempts to restrain our ability to communicate via the
airwaves or the internet as a violation of free speech - period, but I know
that there are loads of real estate agents that would fight me on this
since they seem to prefer one cookie cutter house after another where the
only difference between them is the roof tile color.

Just not for me. For those of you that caved, or didn't know any better,
you can always "try" to fight it, just don't expect the FCC to help you
fight your HOA.

34160. First Impressions

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-18 07:24:56 UTC
From: Jeff Newton
Topic: 538 Message: 34160

Well, so, far, I'm still waiting for a friend to help me with programming the radio into the channel mode portion of the radio, but, I've mastered the frequency portion of programming by hand portion - for now. I had a chance to talk with a buddy ham earlier this afternoon on a local repeater and he reported that I had full quieting and audio with the stock antenna that I had on the radio.

So, that made me a happy camper there with a 20 min QSO or so on the repeater, so good to go so far - radio works well with the stock antenna so far.

I had the battery charge overnight the night before, when I got it yesterday (Monday) and it's still holding a full charge - I'll continue to use that full charge until it runs down for the next two charge per the instructions in the manual that charge it after each use.

I've not yet tried my Kenwood Mic on the radio yet, but, have been told that it would work just fine and dandy. But so far, things are looking promising and I'm still learning how to work this little new toy.

73's,

Jeff KE7OUR

Jeff,

Welcome to the hobby. I'm not sure of your elevation there in OR but here in AZ we're blessed with not only high mountain top repeaters, but linked repeaters, no doubt you have some there as well.

If you haven't already, wait until you use a linked repeater system on your HT to chat with folks hundreds of miles away (with none of the AM noise levels so common on 11 meters). I just purchased the first half of the Kenwood Sky Command system (the HT), now I am looking for a good deal on a TS-480HX 200w mobile HF rig so I can cross-band from UHF to HF while at home, work, or play.

Who knows, maybe we'll work each other on the air someday?

Craig and all,

Thanks it's been great of being in the hobby since I got my ticket back in 2007, I can't believe its been 6 years since the day I found out that I got my ticket, actually today is my anniversary to say of being in the hobby - as I almost forgot about that!

We have plenty of linked repeaters here in Oregon and two systems are very well workable from my QTH in Eugene, the first, Oregon Connection is linked through the Interstate Five Corridor from OR, WA and California via the CARLA System, the other one linked from Mary's Peak in Corvallis, Oregon, which is about a 30 mile drive north of Eugene and has an elevation of about 4,000 feet, can hit about 80 percent of Western Oregon west of the Oregon Cascades and a few linked repeaters to the backside of the eastern portion of Cascades into the Bend and Redmond area from Mary's Peak on the W7PRA repeater.

I've yet to try the new HT on a linked repeater - yet, but that is the course of the plan into later this week into the weekend. I was able to listen to a bit of the traffic on the radio yesterday from the W7PRA repeater, but not engage in any QSO's with those on the repeater yet.

Btw, I heard some nice things about the linked repeaters there in AZ, I was supposed to be in the Phoenix/Mesa area earlier this past spring to join by brother there, but things here have pushed that venture south until the first of the year. Hopefully, I will catch you on the air there, perhaps you know of an Echolink repeater that can be reachable from OR to AZ, as I also have another friend from Oregon that has also relocated to the Mesa area as well.

I've heard about the Kenwood Sky Command System, but have not learned much about it.

73's,

Jeff - KE7OUR

People should be free to make their own choices even if that means they get stuck with stupid socialist HOA rules. They can always sell and get the heck out. I would never live in a communist community like that. The control freak and rules are rules types gravitate to places like that. Anything not a conforming vanilla beige and they'll make life a living hell.

>With PRB-1, the FCC “established a policy of limited preemption of state and local regulations governing amateur station facilities, including antennas and support structures, but expressly decided not to extend its limited preemption policy to CC&Rs in home ownership deeds and condominium bylaws because ‘[s]uch agreements are voluntarily entered into by the buyer or tenant when the agreement is executed and do not usually concern the Commission.’ In 2001, the Commission denied a Petition requesting that the Commission adopt rules to preempt CC&Rs that do not provide reasonable accommodation for Amateur Radio operators, and affirmed that the limited preemption policy of PRB-1 applies only to state and local regulations. The Commission noted that its decision in PRB-1 to exclude CC&Rs from its preemption policy was premised upon the fundamental difference between state and local regulations, with which an Amateur Radio operator must comply, and CC&Rs, which are contractual terms to which the purchaser of a property voluntarily subjects him- or herself.” The FCC also concluded in its PRB-1 decision that “there ha[d] not been a sufficient showing that CC&Rs prevent Amateur Radio operators from pursuing the basis and purpose of the Amateur Service.”

From: Craig Carnahan
Topic: 538 Message: 34164

Just signed up for an Echolink account last week, but haven't had any time to even read the manual yet. Once I do, I really want to set up one of our UV-5R or maybe a B5 unit to show some of the other non-ham members in our group how well it works. I have used the UV-5R on our Zia Link, North Link and Rim Link systems and all of the non-hams were impressed, some enough to sign up for the Ham Test Online training class.

I actually got away with putting two antenna's in my attic that work very
well for the repeaters that I currently work with per my license. Everyone
that lives withing the HOA knows that I am a ham radio operator and a few
peeps have asked about the hobby and why they don't see any antenna's, it
all goes back to the HOA Rules regarding antenna's and satellite dishes and
the likes, but those on the board rather not see a farm on the roofline,
rather than basics of emergency communications - oh well, one of these
day's they'll learn the need of such communications will be needed and
point blank.

Violation of free speech has only to do with government suppression. It has nothing to do with your right to give it up freely by signing a document that you choose to sign when you purchase a home.

That is why I checked that out before I bought my home

Topic: 34064 Message: 34168

Cheers Bill

... and 'yes' ... I figured the different spacing bit out when I tried to plug my headset in ... and noted they were 'tother way round when I read the "SP & MIC" label on the side of the radio [:p] .

But thanks for pointing it out anyway ... sometimes U can miss the obvious?

Regards

Brian

34169. RE: Re: [baofeng_uv5r] RE: HDTV antenna for 5R

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-18 14:13:31 UTC
From: <k4ize-bw@...>
Topic: 34097 Message: 34169

There are several options available that work well, and may get by the HOA snoops. First, check if the HOA allows outside flags. That opens a whole net set of options.

I prefer the J-pole, but it does tend to be visible when made from 1/2" copper pipe. The plain old ground plane is a huge improvement over the antenna on the HT. I have a simple, cheap, dual-band mobile antenna mounted on an improvised base with four radials made from aluminum rod from Lowes. You can even use #12 solid copper wire. Most Comet and MFJ antennas are black, and you can spray the base and radials.

Definitely buy or build an antenna specifically for the bands you plan to use. Both the J-pole and the ground plane are 50-Ohms. Use the best coax you can afford as loss is high on V/UHF.

HOA's are *contracts*, not laws. They DO overrule most voluntary freedoms from regulation, but not criminal law. PRB-1 is almost useless as written.

Bill - K4IZE

--- In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

That’s true,

The original poster probably wants the fun of making his own antenna which I think building a Jpole or making a directional element styled antenna would be a good project.

Ed Fong has some good antenna building information on his website. Anyone going to the California Pacificon Ham radio 3 day event? They will have an antenna design course.

Subject: Re: [baofeng_uv5r] HDTV antenna for 5R

Impedance matching is easy. Having a resonant antenna that will get the rf out requires modding or finding a frequency the antenna likes which is probably not one you should be transmitting on. What the point if it doesn't send you RF into the air?

Sent from my Verizon Wireless 4G LTE DROID

R Pryor MAEd CETsr <doopsnoop@...> wrote:

It is better to build your own Jpole or drop a slim jim outside your window. Any antenna that is not properly matched will eventually destroy your radio in transmit mode.

You need to have an impedance match and a resonant antenna.

Subject: Re: [baofeng_uv5r] HDTV antenna for 5R

If it isnt tuned when you trannsmitt you will fry the finals, it may hear good on 440 but not as good as a proper antenna.

On Sep 17, 2013 9:26 AM, <toshutrinity@...> wrote:

Guys,

I have a fancy OTA HDTV antenna that is not used with my TV any more. I was wondering whether it might enhance performance of the 5R if hooked up, since it is in the top of the third floor!!!???

Has anyone done this??

Any idea where I might get the correct adaptor??

Homebrew antennas for 2m and 70 cm can be found at Hamuniverse.com.

http://www.hamuniverse.com/antennas.html

Plenty to choose from. Everything from a simple ground plane built on a SO-239 socket to J-poles, Slim-Jims, vertical dipoles, something for everyone.

Scroll down the page halfway to "4. Antennas 50 mhz and up".

Have fun!

From: Michael Black
Topic: 34102 Message: 34172

Here's the list again. I've got my 1st pass test numbers in here.

List is sorted from longest to shortest (i.e. generally the "best" to "worst").

My S meter values will be much more accurate in the next go around with relative dB levels instead of relative S meter values.

I'm noting differences between same-model antennas. The Nagoya's seem to have different lengths, finish, and labeling on some. Most have the imprinted blue label and semigloss finish but a couple have a black sticker and flat black finish. Odd that the "same" antenna has all these differences so might be a fake indicator. I think I may include a picture of each antenna base in the final report.

Lengths are nearest 1/8". I'll also show the results for the extendables in retracted position too. I may try and measure VSWR but quarter waves and their capacitive coupling make that a bit of a flaky measurement. I may be able to generate half decent relative values though.

Ed

I am looking for a thread that was started by Mike about his antenna testing. He had about 6-8 different antennas that he was testing on the 5R and had provided some initial results before I left town.

Tnx

I've used the autopatch feature simply by holding in the PTT and entering the access and telephone numbers on the keypad, but our repeater does not require any non-numeric characters to operate it.

There are several options available that work well, and may get by the HOA snoops. First, check if the HOA allows outside flags. That opens a whole net set of options.

I prefer the J-pole, but it does tend to be visible when made from 1/2" copper pipe. The plain old ground plane is a huge improvement over the antenna on the HT. I have a simple, cheap, dual-band mobile antenna mounted on an improvised base with four radials made from aluminum rod from Lowes. You can even use #12 solid copper wire. Most Comet and MFJ antennas are black, and you can spray the base and radials.

Definitely buy or build an antenna specifically for the bands you plan to use. Both the J-pole and the ground plane are 50-Ohms. Use the best coax you can afford as loss is high on V/UHF.

HOA's are *contracts*, not laws. They DO overrule most voluntary freedoms from regulation, but not criminal law. PRB-1 is almost useless as written.

Bill - K4IZE

--- In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

That’s true,

The original poster probably wants the fun of making his own antenna which I think building a Jpole or making a directional element styled antenna would be a good project.

Ed Fong has some good antenna building information on his website. Anyone going to the California Pacificon Ham radio 3 day event? They will have an antenna design course.

Subject: Re: [baofeng_uv5r] HDTV antenna for 5R

Impedance matching is easy. Having a resonant antenna that will get the rf out requires modding or finding a frequency the antenna likes which is probably not one you should be transmitting on. What the point if it doesn't send you RF into the air?

Sent from my Verizon Wireless 4G LTE DROID

R Pryor MAEd CETsr <doopsnoop@...> wrote:

It is better to build your own Jpole or drop a slim jim outside your window. Any antenna that is not properly matched will eventually destroy your radio in transmit mode.

You need to have an impedance match and a resonant antenna.

OK, Brian. Good luck with your search.
I face a similar task in coming months as I am going to interface one of mine into the intercom on my X-Air ultralight, slightly complicated by the need to be able to switch between the Baofeng and the airband. All doable and fairly straightforward electronics.

Except that there is currently no Federal Law that covers this; the closest you're going to find is the FCC PRB-1 ruling that stated that municipalities cannot unduly restrict antenna structures, which specifically did not cover Codes Covenants and Restrictions.

(Why do I feel like a broken record?)

Which band?
Where in the US?

The common spacing varies from one band to another and from place to place. The common spacing in Eugene Oregon is likely to be different from the spacing in New York City or even San Francisco. Various frequency coordinators have adopted differing band plans - and in many areas there will be a mix of new and legacy repeaters that will not all conform to the same spacing.

34189. Loosing Memory

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-19 02:51:08 UTC
From: kd4zgw
Topic: 34189 Message: 34189

I have had my UV-5R for about 8 months now, and I keep loosing my memory channels. The first glitch I had I couldn't access the menu in channel mode, so I had to do a reset on it and it fixed it. Now Channel 000 has replace itself from 145.130 to 137.000.

Is this the norm for these radios to glitch like this? If so, I think I'll go and buy me a real HT radio.

34190. Re: Loosing Memory

From: Frank Scott
Topic: 34189 Message: 34190

i noticed this on one uv-5r. It only occurred on ch 000. Eventually the audio dropped to about 10% of normal. There is clearly a glitch with that particular batch. it was one of the earlier ones. Since replaced and now used as a backup only and no entry in ch 000

MIKE,

THERE IS AN OLD SAYING, 'PUTTING $10 INTO THE ANTENNA IS LIKE PUTTING $100 INTO THE RIG'.

PUT UP THE BIGGEST ANTENNA AS HIGH AS YOU CAN, AND YOU WILL GET THE BEST SIGNAL.

I REALLY DON'T SEE WHAT YOU ARE TRYING TO SAY, YOU HAVE A GREAT COMPARISON CHART
BUT IT DOESN'T SAY MUCH ABOUT THE OPERATION OF THE ANTENNA, ESPECIALLY THE 'S' METER.
'S' METERS ARE ONLY AN INDICATION OF A SIGNAL RECEIVED, I HAVE WATCHED 'S' METERS
FLUCTUATE BETWEEN S3 & S9+ WITHIN A COUPLE OF WORDS. THE BAR TYPE ARE EVEN LESS
PRECISE. 2 MILES IS HARDLY ANY KIND OF A TEST, 20 MILES MAYBE, 100 MILES IS A REAL TEST.
I REALLY THINK YOU ARE TRYING TO REINVENT THE WHEEL. I THINK YOU ARE HAVING A LOT OF
FUN, WHICH IS GOOD, BUT YOU MAY BE GIVING THE NEWBIES THE WRONG IDEA ABOUT ANTENNAS.

APPRECIATE YOUR EFFORTS BUT THINK YOU COULD BE MORE REALISTIC WITH YOUR TESTING.

AFTER ALL, THE MFGRS OF ANTENNAS GIVE YOU ALL THESE GREAT REPORTS ON THEIR ANTENNAS AND
THEY WON'T WORK WORTH A DAMN IN REAL LIFE.

AS FAR AS LENGTH VS SIGNAL, USE THE LONGEST ONE YOU (THE OPERATOR) ARE COMFORTABLE WITH. IF
IT POKES YOU IN THE EYE, IT MAY BE A LITTLE LONG.

WHEN DOING TESTS USING TEST EQUIPMENT, YOU SHOULD INDICATE WHAT INSTRUMENTS
YOU ARE USING, LENDS CREDIBILITY TO YOUR WORKS.

YOU MENTION SAME ANTS DIFFERENT FINISHES, STICKERS ETC. I THINK IT IS THE SAME AS
THE UV-5R'S, COSMETICS.

JUST TRYING TO BE HELPFUL, NOT CRITICAL.

73,
ZIPPY

Here's the list again. I've got my 1st pass test numbers in here.

List is sorted from longest to shortest (i.e. generally the "best" to "worst").

My S meter values will be much more accurate in the next go around with relative dB levels
instead of relative S meter values.

I'm noting differences between same-model antennas. The Nagoya's seem to have different lengths, finish, and labeling on some. Most have the imprinted blue label and semigloss finish but a couple have a black sticker and flat black finish. Odd that the "same" antenna has all these differences so might be a fake indicator. I think I may include a picture of each antenna base in the final report.

Lengths are nearest 1/8". I'll also show the results for the extendables in retracted position too. I may try and measure VSWR but quarter waves and their capacitive coupling make that a bit of a flaky measurement. I may be able to generate half decent relative values though.

Mike

this is Excellent work!!! I continue to look forward to your findings. Did Smiley send you a replacement, since I have one of those and it did not fall apart, but the stock stubby seems to work better which is surprising....I thing it is their SMA connector, which I have posted pictures of previously. BTW, they did send me a second connector and it did not improve things.

Tony

34195. RE: HDTV antenna for 5R

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-19 13:50:38 UTC
From: <toshutrinity@...>
Topic: 34097 Message: 34195

R Pryor,

Nope, I do not want the "fun" of homebrewing my own antenna. Just got my ticket a few weeks ago and the Baofeng, and I am trying to figure out how to do things for the least amount of money and take advantage of the HDTV antenna that is messed up on my roof. I need to take it down or use it....either way, I will have to pay someone to go on the roof to do that for me since I cannot, due to my health.

It does sound like I may be better off just having the HDTV antenna taken down, and a 2m and 70CM antenna put up on the post in its place. I recall someone on here suggesting one that cost about $40 or so. Since the HDTV antenna is up about 35-40 ft in the air, above sea level, and I live in flatlands, that should significantly improve the performance of my HT, and in the future, I should be able to use it when I upgrade ...

How do I check if the existing cable is OK to use??

T

WRONG! HOA's Can't trump federal laws and that is FACT. A guy in my neighborhood fought and won against the HOA so he could put up a j-pole.

Fighting this would be A HUGE good thing to do.

On Tue, Sep 17, 2013 at 3:31 PM, Craig Carnahan <craig.n7lb@...> wrote:

When you moved into your commune (HOA) you signed a waiver to your rights by agreeing to the commune's CCR's and their HOA. I would personally never agree to give up my right to free speech (radio), but in your case the damage is done.

You could certainly fight them in court (and depending on your state's laws, the skill of your attorney, and the size of your wallet, you might even win, but the odds are long since you willingly gave up your "rights" by signing their paperwork, which is why so many ham's

were hoping the FCC would put some federal muscle behind PRB-1).

Your best bet may be to get and use a hidden antenna, like a Ventenna (http://www.ventenna.com/).

On Tue, Sep 17, 2013 at 12:07 PM, Matthew Pitts <daywalker_blade_2004@...> wrote:

Actually, they (HOA Codes, covenants and restrictions) are specifically NOT covered by PRB-1, and it seems that the FCC, when asked to rule on this in the last year, chose to retain the status quo.

Matthew Pitts

> have an HDTV antenna...

You'll have to make a stink, but HOAs CANNOT restrict your ability to communicate via radio - HOA covenants do not trump US Federal laws. Sometimes you have to fight them on that, because they can still impose fines - even when they're in the wrong.

ARRL members have the benefit of an army of lawyers which will defend your right to communicate in the face of those pesky HOA teetotalers.

(Also, fishing line as antenna support is less visible, if that helps)

Thanks for sharing.
Something like this might work very well in my camper where there already is a battery, and a need for greater range outdoors.
Please keep me/us informed as to your dual band amp testing and share pictures of your set up.

T

--- In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

The Amp that was used was a TC 450 UHF amp, priced after Shipping was around $130

Connections used std pl259 uhf with a sma pigtail with a coax BNC end. On the Boafeng was a coax male end to a SMA F

The Antenna was a Slim Jim roll up antenna in line with a dual band VSWR/FPWR meter to monitor vswr and actual power output.

Power supply was a radio shack 19A model 12 vdc

The amp was really impressive for the price and had no heat issues or other conditions. A dual band amp will be tested next.

Spectrum analyzer was a tek 492

Could you share the details of the exact components tested and used here. This sounds very interesting!!!!!!

kc3bcw

--- In baofeng_uv5r@yahoogroups.com, <doopsnoop@...> wrote:

There are 3 different versions of the antenna out now as the latest BFBS311 versions came with a new looking one.

1. Std rubber ducky most of us have seen

2. A longer version with a tapered end (often was the one to come with the camo versions)

3. The latest showing up in the 311’s is a longer version (like number two above) but with a cylinder shaped end.

After looking at hundreds of these as we run Tech classes and are purchasing equipment for the upcoming (next year) Pathfinder's International Jamboree we expect a couple of hundred to be used at the International Jamboree for the Southern California conference area. All properly licensed groups will be receiving one unit.

Kurt from Three Crows probably has seen other versions too. Another member stated it is whatever rolls out during the assembly line that is put in the package. I feel this is true as they have shown up in mixed batches. However, the chances of getting the longer versions is greater if the radio is another color other than Black.

Speaking of Antennas, we just got a version in that is longer than the 771 series that uses a thin whip extension for the last few inches and will be testing it. The gain as stated on the package is higher.

With the extension piece being thin and very flexible compared to the 771 series, this means the problems users had with the antenna poking them when carrying on a belt or clip is not an issue as you do not feel the antenna at all for comfort carry. Will advise later about this version.

Another item is UHF amps, someone tested in our group a 40W version that was connected to an SMA pigtail to PL259 to the AMP. From the Amp it ran into a power/swr meter and into a Slim Jim roll up antenna roof mounted. A spectrum analyzer was connected at the initial start to look at spectral purity. The whole setup is very portable.

the results were really good as follows:

Within the 10Mhz tuning step gain was a good 40Watts. A few mhz outside the 10 mhz area the 3db power points were evident. So the Amp is a very flat frequency response with a large drop off of attenuation outside the 10mhz step. This eliminates the concern others had that the UV5R would be a spurious noise and harmonics source outside the intended bands.

Spectral analysis confirmed any spurious noise or harmonic generation was down low enough to not be a major concern while looking at the response portion of the 10mhz tuned range.

VSWR readings were 1:1.5 at the highest level, generally VSWR seemed to be almost 1:1.

Repeaters more than 50-miles away could be reached. The unit is rated at 10amps and can be AC-DC power supply connected or car battery connected. A small portable easily carried 12 vdc battery could be used for short transmissions. This gives the whole setup an easy portability factor for hiking, camping or to be used in an emergency.

Therefore, this is a doable for those would have the need to do this, while I would use a dedicated mobile unit for a car setup. A backpack or bug-out bag portable capability is an option as the selection of the lightest battery source is the greatest concern. Even a portable Gel-cell that would provide 10a could be used with the uv5 set at H power. Add that with some type of solar charge ability to the battery source you would have a winner.

KK6CRP

BTW the amp tested was just over $100.

Subject: RE: Re: [baofeng_uv5r] RE: Antenna question?

I just received my uv-5r Friday from radioshop888. The antenna on it was 4 3/4 inches long. I had no trouble hitting the repeater 20 miles away. It was very easy to load the memories using Chirp. I had trouble using the Baofeng software until I went back a revision on the usb drivers (miklor.com has directions). I would stick with Chirp. I also have a kenwood TH-F6 and all my accessories including the programing cable worked with the UV-5R.

Rupert,

I'm not sure what the standard length is on the stock antenna, but I have seen a few YouTube video of several people getting the newer antenna with the radio over the original stock antenna. I will let everyone one once it gets here.

Jeff KE7OUR

On 9/16/2013 03:39, rkeep@... wrote:

Hi Jeff.

My new uv-5r+ came with antenna that is 17.5cm long. The seller described it as new and improved.

What length is the standard one?

Cheers

Rupert G7SPE

Yes…Smiley replaced that antenna gratis.

Zippy is basically correct…bigger/higher is better. But I disagree with his 20/100 mile analogy as in my case I doubt any of these would work at those distances. I'm not testing a repeater here. I do intend to take these out farther and test one distance at the fringe to confirm consistency -- theoretically more dB should mean more distance and I sincerely hope that's empirically true in my test (another sanity check).

I have calibrated my S meter and can now give dB ratings when I do the test. And the SWR does not vary on my ICOM 706MKIIG during testing at all. It's rock solid. I'm reading the S meter via computer now so can provide quite accurate averaged readings (though the numbers are very consistent)
All I'm doing is operating these antennas in a very consistent manner with a UV-5R just like most people do -- held in front of your face -- plus mobile antennas.
If anybody can show my any other test which is even close to what I'm doing I'm all ears (pun intended). I'm just tired of everybody giving anecdotal info on one or two antennas.
Very true that YMMV depending on the propagation mode to your target.
As for antenna markings my SWR tests right now show notable differences between marking sets. Hopefully the signal testing confirms that and may be an indication of fakes (is the fake better or worse though?).

My testing will be fully documented with every bit of info involved including both systems, calibration, weather, elevation profile, and whatever else I think of.

I still have a few antennas in the mail so I'll be up to 30 antennas.

Mike

this is Excellent work!!! I continue to look forward to your findings. Did Smiley send you a replacement, since I have one of those and it did not fall apart, but the stock stubby seems to work better which is surprising....I thing it is their SMA connector, which I have posted pictures of previously. BTW, they did send me a second connector and it did not improve things.

Tony

MIKE,

THERE IS AN OLD SAYING, 'PUTTING $10 INTO THE ANTENNA IS LIKE PUTTING $100 INTO THE RIG'.

PUT UP THE BIGGEST ANTENNA AS HIGH AS YOU CAN, AND YOU WILL GET THE BEST SIGNAL.

I REALLY DON'T SEE WHAT YOU ARE TRYING TO SAY, YOU HAVE A GREAT COMPARISON CHART
BUT IT DOESN'T SAY MUCH ABOUT THE OPERATION OF THE ANTENNA, ESPECIALLY THE 'S' METER.
'S' METERS ARE ONLY AN INDICATION OF A SIGNAL RECEIVED, I HAVE WATCHED 'S' METERS
FLUCTUATE BETWEEN S3 & S9+ WITHIN A COUPLE OF WORDS. THE BAR TYPE ARE EVEN LESS
PRECISE. 2 MILES IS HARDLY ANY KIND OF A TEST, 20 MILES MAYBE, 100 MILES IS A REAL TEST.
I REALLY THINK YOU ARE TRYING TO REINVENT THE WHEEL. I THINK YOU ARE HAVING A LOT OF
FUN, WHICH IS GOOD, BUT YOU MAY BE GIVING THE NEWBIES THE WRONG IDEA ABOUT ANTENNAS.

APPRECIATE YOUR EFFORTS BUT THINK YOU COULD BE MORE REALISTIC WITH YOUR TESTING.

AFTER ALL, THE MFGRS OF ANTENNAS GIVE YOU ALL THESE GREAT REPORTS ON THEIR ANTENNAS AND
THEY WON'T WORK WORTH A DAMN IN REAL LIFE.

AS FAR AS LENGTH VS SIGNAL, USE THE LONGEST ONE YOU (THE OPERATOR) ARE COMFORTABLE WITH. IF
IT POKES YOU IN THE EYE, IT MAY BE A LITTLE LONG.

WHEN DOING TESTS USING TEST EQUIPMENT, YOU SHOULD INDICATE WHAT INSTRUMENTS
YOU ARE USING, LENDS CREDIBILITY TO YOUR WORKS.

YOU MENTION SAME ANTS DIFFERENT FINISHES, STICKERS ETC. I THINK IT IS THE SAME AS
THE UV-5R'S, COSMETICS.

JUST TRYING TO BE HELPFUL, NOT CRITICAL.

73,
ZIPPY
PS: FOR FLEXIBILITY, I LOVE THE COMET SMA24J, TIE IT IN A KNOT. JUST DON'T KEY IT!

Subject: RE: [baofeng_uv5r] RE: Missing message from Feb 8-Sept 14 in this forum

Here’s the list again. I’ve got my 1st pass test numbers in here.
List is sorted from longest to shortest (i.e. generally the “best” to “worst”).
My S meter values will be much more accurate in the next go around with relative dB levels instead of relative S meter values.
I’m noting differences between same-model antennas. The Nagoya’s seem to have different lengths, finish, and labeling on some. Most have the imprinted blue label and semigloss finish but a couple have a black sticker and flat black finish. Odd that the “same” antenna has all these differences so might be a fake indicator. I think I may include a picture of each antenna base in the final report.
Lengths are nearest 1/8”. I’ll also show the results for the extendables in retracted position too. I may try and measure VSWR but quarter waves and their capacitive coupling make that a bit of a flaky measurement. I may be able to generate half decent relative values though.

The FCC will never rule on Covenants and PRB-1 because Covenants are PRIVATE agreements. If you want to sell your soul to the devil, the Government is not going to stop you.

If you're that stupid to give away your rights..
Such as no pickup parking, no Christmas lights, or flying of the American Flag. That's your problem.. Those 3 have been in the news in the past few years.

Personally- How could anyone give up a list of rights to live in certain "self proclaimed status" neighborhoods??
What gets me the most is that they agree to agree to ANYTHING the nuts think of in the future no matter how kooky it is...It's 1 person against everyone else.

How can anyone unequivocally agree to any unknowns in the future?

Now I can't tell you anything regarding a coaxial fed HDTV antenna, but if you have a twin-lead analog TV antenna of the log-periodic type (looks like a trilobite, or fish skeleton), all you would need is a 50 to 300 ohm balun. If there was any mis-tune, your radio would get warm before any damage occurred (the backplane under the battery). You would also want to turn the shaft of the antenna 90 degrees to vertical polarity (fish on it's side), and on a fiberglass support w/ rotator.

Do all this, and you should have a "TV" antenna that is good for 6, 2, 1.25 meters, and 70 cm. If you want to try for the 900 band, you best get a swr meter, or better, and antenna analyzer first.

Actually, checking tune at any of the previous mentioned bands is the best idea, but PROBABLY not necessary. The finals in HTs are usually quite strong, and this is due to antennas being quite prone to invisible internal damage.

Most of all, Good Luck!

You'll have to make a stink, but HOAs CANNOT restrict your ability to communicate via radio - HOA covenants do not trump US Federal laws. Sometimes you have to fight them on that, because they can still impose fines - even when they're in the wrong.

ARRL members have the benefit of an army of lawyers which will defend your right to communicate in the face of those pesky HOA teetotalers.

(Also, fishing line as antenna support is less visible, if that helps)

Subject: Re: [baofeng_uv5r] RE: HDTV antenna for 5R

Hello,

You might want to look at the slim jim setup. The beauty of this antenna is it can be pulled up via rope or fishing line and hung in a tree. Then rolled up to fit in a backpack unit. As long as it doesn't get near metal to detune it it works well.

You can stretch it between pvc pipe frame shaped like a [
, this is what I did then you either stick it on a mast or hang it with the pvc keeping its shape and preventing it from flapping near metal.

The HDTV will give you receive signals if matched correctly so the signals are not loaded down. However, on transmit all the power you are going to send up will be lost mostly coming back via reflection. So the slim-jim allows you to match both xmt and receive.

I bought mine from http://www.n9tax.com/Slim%20Jim%20Info.html

http://www.2wayelectronix.com/

Also do not get the SMA end if you will have a long run, go with the RF UHF pl259 with the rg58 at 16'. You can always extend this length but it can withstand more abuse than the sma version.

I think this will work well for you for the cost involved, portability and installation. In the long run you want a good directional setup to run from a dedicated base station with a good receiver front end. This should be motorized to move your antenna as required or you can get a whip style like this one

http://www.hamradio.com/detail.cfm?pid=H0-008572

It sounds like you have the land and space to do some fun things when finances allow, for the HDTV cable it will be 75 ohms while your radio is 50 ohms, so you need to match this before you can use it for xmt. To test the cable generally we would use a TDR (Time domain reflectometer) and a megger for insulation testing.

Using the TDR you can dial in any slight impedance discrepancies, even bends will have a certain response. I can guess you probably wont be able to get one, possibly a local club might have one. Unless the cable is new I would dedicate new cable for this task. The good thing about the slim jim is you just haul up the whole stretched unit in its frame and use the cable hanging from it.

enjoy

Subject: [baofeng_uv5r] RE: HDTV antenna for 5R

R Pryor,

Nope, I do not want the "fun" of homebrewing my own antenna.
Just got my ticket a few weeks ago and the Baofeng, and I am trying to figure out how to do things for the least amount of money and take advantage of the HDTV antenna that is messed up on my roof. I need to take it down or use it....either way, I will have to pay someone to go on the roof to do that for me since I cannot, due to my health.

It does sound like I may be better off
just having the HDTV antenna taken down, and a 2m and 70CM antenna put up on the post in its place. I recall someone on here suggesting one that cost about $40 or so. Since the HDTV antenna is up about 35-40 ft in the air, above sea level, and I live in flatlands, that should significantly improve the performance of my HT, and in the future, I should be able to use it when I upgrade ...

How
do I check if the existing cable is OK to use??

T

Hello folks,

I have been doing a little research, trying to find a good power supply that I can use indoors with the battery eliminator in order to use the UV-5R as a base station. I found one recommendation for the Pyramid PS9KX 5A/7A however this particular supply seems to have gotten some really crummy reviews.

Can someone please recommend a decent supply that I could use that would serve this purpose (using the UV-5R with the battery eliminator indoors)?

Thank you for the assistance.

73,

Ken

The "problem" with Pyramid is that they are overrated. If you only use
them at half of their rated capacity you'll be OK. I find lots of power
supplies at ham fests.

RADIO SHACK USED TO SELL A 4 OR 5 ELEMENT VHF ANTENNA THAT COULD EASILY BE REVAMPED FOR 2 METERS, 1.5:1 SWR OVER WHOLE BAND. I BUILT ONE AND USED IT FOR MARS FROM POTTER CO PA TO STATE COLLEGE PA, OVER 60 MILES, THE SIGNAL WAS A LITTLE SCRATCHY BUT QUITE USEABLE (USING A RS HTX242). A LARGER BEAM WOULD BE BETTER, BUT I WANTED A SMALL UNNOTICEABLE ANTENNA AND THIS ONE WORKED WELL. THE THING WITH THE UV5R OR ANY LOW POWER RIG IS TO GET THE MOST POWER TO THE RADIATING ELEMENT AND NOT LOSE ANY TO CONNECTORS, FEED LINE, PROXIMITY TO METAL SIDING, GUTTERS ETC. REMEMBER, ANTENNA TUNERS ONLY LET THE RIG SEE A PERFECT 50 OHMS EVEN THOUGH AN ANTENNA MAY BE 75 TO 90 OHMS FOR A DIPOLE, AND SEVERAL THOUSAND OHMS FOR A NON RESONANT ANTENNA. THERE IS A LOT OF INFO ON HAM ANTENNAS AT A MULTITUDE OF WEB SITES. IF YOU ARE REALLY INTERESTED IT WILL TAKE A WHILE TO LEARN. IF YOU ARE NOT INTERESTED THEN YOU HAVE TO RELY ON WORD OF MOUTH (BEST) OR MFGRS SPECS (SELF SERVING).

Now I can't tell you anything regarding a coaxial fed HDTV antenna, but if you have a twin-lead analog TV antenna of the log-periodic type (looks like a trilobite, or fish skeleton), all you would need is a 50 to 300 ohm balun. If there was any mis-tune, your radio would get warm before any damage occurred (the backplane under the battery). You would also want to turn the shaft of the antenna 90 degrees to vertical polarity (fish on it's side), and on a fiberglass support w/ rotator.

Do all this, and you should have a "TV" antenna that is good for 6, 2, 1.25 meters, and 70 cm. If you want to try for the 900 band, you best get a swr meter, or better, and antenna analyzer first.

Actually, checking tune at any of the previous mentioned bands is the best idea, but PROBABLY not necessary. The finals in HTs are usually quite strong, and this is due to antennas being quite prone to invisible internal damage.

Most of all, Good Luck!

You only need to have the right element lengths and the right spacing between them.
It's not rocket science. Google 2 meter beams and you'll find lots of plans.

For those wanting to experiment with this sort of stuff on the cheap, look into building a tape measure yagi.

If I were going to do that I'd just buy a 12V battery and a float a charger on it. Like many ham shacks do for their operating power.

That gives you emergency backup too for days and costs about the same as the Pyramid.

Something like a PS-1250 F1 *(5 Amp hr which is) which I have used for other projects. Or get a slightly larger battery and then you can charge your radio battery from the floater too….even more emergency capability. Since the UV-5R batteries are 1.8Ah and 3.8Ah I wouldn't charge them from a 5Ah battery….maybe a 10Ah in that case.

http://www.amazon.com/PS-1250-F1-Volt-Replacement-Battery-Terminal/dp/B007T6QR6O

And a CM1A charger for example:

http://www.impactbattery.com/schauer-cm1a-battery-tender-jr-charger.html?gclid=COeFoqH_2bkCFbE7MgodtxgAgg

Then add a cig lighter socket so you can plug in your eliminator.

Subject: [baofeng_uv5r] Recommended Power Supply for UV-5R

Hello folks,

I have been doing a little research, trying to find a good power supply that I can use indoors with the battery eliminator in order to use the UV-5R as a base station. I found one recommendation for the Pyramid PS9KX 5A/7A however this particular supply seems to have gotten some really crummy reviews.

Can someone please recommend a decent supply that I could use that would serve this purpose (using the UV-5R with the battery eliminator indoors)?

Thank you for the assistance.

73,

Ken

There ISN'T a message gap as such; Yahoo has been rolling out a new user interface since early August that is completely different and displays only the first and latest message in a given thread by default. An easy way to tell if you are seeing this new interface is to look for the word "neo" in the URL. Google Yahoo Groups neo for more information.

The marine battery is a good choice for this app, it is designed for repeated charges or a gall cell type. And in the future you can always add a solar cell for those extended power outages...

The antenna was the now discontinued Radio Shack 15-2163.

Reported to be the same antenna as Antennacraft FM6.

Attachments: 2 described; binary payloads are missing from this source WARC

Depends completely on how you use it.

I just ran a test and these are my results on my UV-5R.

An interesting result is when I threw on the MFJ-1714S the power consumption dropped considerably. So the antenna does have an effect on power consumption.

And the MFJ didn't show as big a drop which I think is due to the heat dissipation being better as it has a good bit of metal at the base of the antenna.

The resulting formula for the stock antenna should be approximately:

B = Battery capacity in amps

D = duty cycle rag chew percentage (i.e. 50% = 0.5)

H = hours

H = B/((D*.5*2.642) + (D*.5*.129) + ((1-D)*.044))

So this D value above is the % time you are chatting with someone on your radio as opposed to just transmitting as the battery consumption is different. I think this is the best way to estimate typical usage of this radio.

For receive only this simplifies to this where D is the % time in receive mode:

H = B/((D*.129)+((1-D)*0.44))

Mike W9MDB

Here's a chart for you

And here's my power consumption tests:

Ok here is the history
1. Downloaded CHIRP. 2. Filled out the csv information, 3.Plugged in the cable, 4. Turned on the unit the changes did not take and now the audio will not work. The radio did work for the upload when I turned it on Went Red, then Flashed Red then Green.

5. Results: No audio - No updated channels.

Can any one suggest fix for the audio..
PS. Found out I am not using the USB 3.2.2 driver for the up load

After the first night I nearly threw it into the dustbin lol.. for me, one night trying to get my pc to talk to the download cable, eventually suceeded after uninstalling and reinstalling several times.
2nd night, making the software work... no matter what I try i could not, and still can not get the software to allow me to type a file name into the "save" box.. I eventually did it by pasting an empty "txt" doc into the dat directory and renaming it "mydata.dat" now i just click on the file name to save and it works.
3rd night compiling a list of frequencies to program and saving then to the pc.
4th night, up and running and very very pleased with it... now that ive worked out how to stop that annoying voice that tells me the channel number..
Brilliant handie so far..

Martin,

Yes. The software certainly has its peculiarities. That's why I use CHIRP. But I do keep the OEM software around to support those that wish to use it. There is nothing wrong with using it.

Make sure you click in the box and completely replace the "*.dat" that is contained within it.

Like you mentioned, a workaround is to just create an empty file with Notepad and save it with a .dat extension. Then you can just click the name in the list of available .dat files.

It should last a couple of months, provided you don’t turn the radio on.
If you turn it on, it will last a shorter period of time, depending on whether or not you receive any signals, what volume you use to listen to the received signals, and whether or not you do any transmitting, and whether you transmit on low or high power.

Subject: [baofeng_uv5r] battery question

Since I got the radio on Monday, I've only charged the battery once since I unboxed the radio from delivery - I was wondering has anyone figured out on how long the battery last's between charges?

Yes, I have the extended version battery.

Radio shack Model: 20-043 for $80 is good (although there are better and cheaper antennas available elsewhere); but Model: 20-176 for $30 is adequate for a dual band HT and is a lot less obvious.

Now I can't tell you anything regarding a coaxial fed HDTV antenna, but if you have a twin-lead analog TV antenna of the log-periodic type (looks like a trilobite, or fish skeleton), all you would need is a 50 to 300 ohm balun. If there was any mis-tune, your radio would get warm before any damage occurred (the backplane under the battery). You would also want to turn the shaft of the antenna 90 degrees to vertical polarity (fish on it's side), and on a fiberglass support w/ rotator.

Do all this, and you should have a "TV" antenna that is good for 6, 2, 1.25 meters, and 70 cm. If you want to try for the 900 band, you best get a swr meter, or better, and antenna

analyzer first.

Actually, checking tune at any of the previous mentioned bands is the best idea, but PROBABLY not necessary. The finals in HTs are usually quite strong, and this is due to antennas being quite prone to invisible internal damage.

Most of all, Good Luck!

R Pryor,

Nope, I do not want the "fun" of homebrewing my own antenna. Just got my ticket a few weeks ago and the Baofeng, and I am trying to figure out how to do things for the least amount of money and take advantage of the HDTV antenna that is messed up on my roof. I need to take it down or use it....either way, I will have to pay someone to go on the roof to do that for me since I cannot, due to my health.

It does sound like I may be better off just having the HDTV antenna taken down, and a 2m and 70CM antenna put up on the post in its place. I recall someone on here suggesting one that cost about $40 or so. Since the HDTV antenna is up about 35-40 ft in the air, above sea level, and I live in flatlands, that should significantly improve the performance of my HT, and in the future, I should be able to use it when I upgrade ...

How do I check if the existing cable is OK to use??

You'll have to make a stink, but HOAs CANNOT restrict your ability to communicate via radio - HOA covenants do not trump US Federal laws. Sometimes you have to fight them on that, because they can still impose fines - even when they're in the wrong.

ARRL members have the benefit of an army of lawyers which will defend your right to communicate in the face of those pesky HOA teetotalers.

(Also, fishing line as antenna support is less visible, if that helps)

The air band uses amplitude modulation (e.g. AM) and most Cell bands use digital, the UV-5R only receives/transmits using frequency modulation, so even if it covered these bands (which it does not), you would not hear anything.

You can reset the radio to the factory default settings via menu option #40.

I wish people would realise there is no such thing as an "HD"
antenna, just as there is no such thing as a digital one. They
will receive (or transmit) any form of signal equally well, and
the concept of "needing a new aerial for digital" is just a con
perpetrated by the retailers on the unsuspecting public.

Having got that off my chest, I wouldn't use the aerial (known as
a "grid") in the OP's photo for 70cm; it will not be tuned correctly.

If the TV aerial is not in use, and you have access to it, then
as someone else suggested you could do worse than to remove it
and fit a 2+70 dipole or slim jim in its place - it's possible
you might fall foul of the HOA regulations, but they are unlikely
to know the difference between one aerial and another as long as
the number of them hasn't changed! Otherwise fix a diple or SJ to
a broom handle and stick it out of the window, bringing it back
in when not required.

If you replace the TV aerial, remember to replace the feeder as
well; it will not match correctly - and if it's been there a
while, could well be in poor condition.

Topic: 34199 Message: 34242

Don't be too sure - covenants in my community prohibited satellite dishes 18 years ago; the FCC has pre-empted the issue of satellite dishes, and they are now allowed in the community where I live.

Flying the American flag in our community had to be from a house mounted staff; the governor signed legislation permitting flagpoles in covenanted neighborhoods, and I believe the federal government has done the same. I have a 15' flagpole in my yard.

Since the streets were deeded over to local government, the covenants against parking in the street are not enforceable.

PRB-1 may be the next to go, under "reasonable accommodation" rulings by the FCC.

In order to enact new restrictions under the covenants, 70% of the homeowners have to agree - good luck on that - we can't even get 50% to the annual meeting.

Subject: [baofeng_uv5r] Covenants and PRB-1

The FCC will never rule on Covenants and PRB-1 because Covenants are PRIVATE agreements. If you want to sell your soul to the devil, the Government is not going to stop you.

If you're that stupid to give away your rights..
Such as no pickup parking, no Christmas lights, or flying of the American Flag. That's your problem.. Those 3 have been in the news in the past few years.

Personally- How could anyone give up a list of rights to live in certain "self proclaimed status" neighborhoods??
What gets me the most is that they agree to agree to ANYTHING the nuts think of in the future no matter how kooky it is...It's 1 person against everyone else.

How can anyone unequivocally agree to any unknowns in the future?

34243. Purpose of the charger/battery center terminal?

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-20 22:11:21 UTC
From: <topossibilities@...>
Topic: 34243 Message: 34243

Initially I thought this terminal might be for temperature sensing feedback control, but after looking at the schematics for both the UV-5R and charger, it appears to not serve any purpose (e.g. no connections to the center terminal).

Just wondering, at $30 and a retired EE, I bought several of these, with the intent of hacking/modifying a few.

do you have receive tones on also? Unless a transmission from another radio has the same tone it will be no audio. I hve done that before.

Correct. Remove 4 screws from the bottom of the charging cradle and remove the bottom (it comes of easily). You will see that the center tab is not connect to anything.

Yes, the Radio Shack "$25 FM Antenna" (now higher) was the Antennacraft FM6. I have an FM6 and it works fabulously... with my Onkyo T-4500 tuner with filter mods (new low loss Murata 180 khz for wide mode, and 150 khz for narrow mode filters). I haven't even thought about using it for the UV-5R.

> RADIO SHACK USED TO SELL A 4 OR 5 ELEMENT VHF ANTENNA THAT COULD EASILY BE REVAMPED FOR 2 METERS, 1.5:1 SWR OVER WHOLE BAND. I BUILT ONE AND USED IT FOR MARS FROM POTTER CO PA TO STATE COLLEGE PA, OVER 60 MILES, THE SIGNAL WAS A LITTLE SCRATCHY BUT QUITE USEABLE (USING A

RS HTX242). A LARGER BEAM WOULD BE BETTER, BUT I WANTED A SMALL UNNOTICEABLE ANTENNA AND THIS ONE WORKED WELL. THE THING WITH THE UV5R OR ANY LOW POWER RIG IS TO GET THE MOST POWER TO THE RADIATING ELEMENT AND NOT LOSE ANY TO CONNECTORS, FEED LINE, PROXIMITY TO METAL SIDING, GUTTERS ETC. REMEMBER, ANTENNA TUNERS ONLY LET THE RIG SEE A PERFECT 50 OHMS EVEN THOUGH AN ANTENNA MAY BE 75 TO 90 OHMS FOR A DIPOLE, AND SEVERAL THOUSAND OHMS FOR A NON RESONANT ANTENNA. THERE IS A LOT OF INFO ON HAM ANTENNAS AT A MULTITUDE OF WEB SITES. IF YOU ARE REALLY INTERESTED IT WILL TAKE A WHILE TO LEARN. IF YOU ARE NOT INTERESTED THEN YOU HAVE TO RELY ON WORD OF MOUTH (BEST) OR MFGRS SPECS (SELF SERVING).

If I were going to do that I'd just buy a 12V battery and a float a charger on it. Like many ham shacks do for their operating power.
That gives you emergency backup too for days and costs about the same as the Pyramid. Something like a PS-1250 F1 *(5 Amp hr which is) which I have used for other projects. Or get a slightly larger battery and then you can charge your radio battery from the floater too….even more emergency capability. Since the UV-5R batteries are 1.8Ah and 3.8Ah I wouldn't charge them from a 5Ah battery….maybe a 10Ah in that case.
http://www.amazon.com/PS-1250-F1-Volt-Replacement-Battery-Terminal/dp/B007T6QR6O
And a CM1A charger for example:
http://www.impactbattery.com/schauer-cm1a-battery-tender-jr-charger.html?gclid=COeFoqH_2bkCFbE7MgodtxgAgg
Then add a cig lighter socket so you can plug in your eliminator.

Subject: [baofeng_uv5r] Recommended Power Supply for UV-5R

Hello folks,

I have been doing a little research, trying to find a good power supply that I can use indoors with the battery eliminator in order to use the UV-5R as a base station. I found one recommendation for the Pyramid PS9KX 5A/7A however this particular supply seems to have gotten some really crummy reviews.

Can someone please recommend a decent supply that I could use that would serve this purpose (using the UV-5R with the battery eliminator indoors)?

Thank you for the assistance.

I primarily use the programming software from Baofeng for my UV5R. I had a similar frustration until it finally dawned on me that for the Chinese "Save" means "Save As" and "Save As" means "Save". So when I want to save the settings as a new file, I select "Save" and get a file name / location dialog box; and when I simply want to save a file over the existing, open file I select "Save As" and it saves to the existing open file without any dialog!!!

Indeed, we can - and do - solicit proxies. Unfortunately, in a "good" year, we only get about 25% proxies sent in; that means we have to attempt a month later to hold another try at an annual meeting, since we do not achieve the 51% participation required.

With that low of a turnout, the board must be doing an acceptable job of managing the community and our resources. I have served on the board for 5 years.

All,

I am very new to the HAM radio world - so new that I am still preparing for the Technician test - with my wife (very cool).

A week ago we went to a Hamfest and this guy was selling the UV-5RA. So we picked one up so that we could listen to some repeater activity.

After then realizing how much of a good little radio this is I decided to see if I could program it with scannable memory groups - meaning I want to be able to assign frequencies to certain channels (no problem there) and then I want to assign certain channels to certain groups. For instance.

CH-001 Group A
CH-002 Group A
CH-003 Group A

CH-004 Group B
CH-010 Group B
CH-027 Group B

CH-005 Group C ......

Then I want to be able to scan by memory channel group rather than all channels in memory. Is that possible with this radio ?

Thanks in advance.

Pete

No. The UV-5R family of radios only has 1 group of 128 memory channels.
These channels can only be divided up in 3 ways:

Programmed and scannable
Programmed and not scannable (requires software)
Not-programmed

The same group of 128 channels is available in both the top [A] and bottom
[B] displays.

No.

If you program the radio by software (not the keypad) you can choose whether or not to scan each individual memory channel, but there is no way to have multiple groups of channels to scan.

BTW, this radio is very nearly the world's WORST scanner -- the scan rate is too slow to be really effective, the radio suffers terribly from intermod, and it lacks most of the options that are standard on just about any real scanner.

This is an excellent two channel dual band ham radio, with 128 memories available -- but its ability to scan is just barely usable.

The best advice is to be happy with it as a ham radio -- but if you need (or just want) a scanner, look elsewhere.

Is anyone at Ubuntu or Debian maintaining the package? I haven't checked, since I just grab this one from the site and keep it separate from the software apt installs. Especially in Ubuntu, many niche packages like this get a build but never get updated.

I just download the Chirp binary to a directory in my home directory and run it from there. The only problem I've run into is not getting the display of firmware version; I had to run it in Windows to finally find out my firmware version. Everything else seems to be OK.

Subject: [baofeng_uv5r] RE: Frustration and first impresion

I primarily use the programming software from Baofeng for my UV5R. I had a similar frustration until it finally dawned on me that for the Chinese "Save" means "Save As" and "Save As" means "Save". So when I want to save the settings as a new file, I select "Save" and get a file name / location dialog box; and when I simply want to save a file over the existing, open file I select "Save As" and it saves to the existing open file without any dialog!!!

Correct. The "save as" has never worked with either the Baofeng CPS or VIP software for the UV-5R.

How do you mean you get and "unusable dialogue box" when selecting "save"? Is the "Save File" box (where it has "*.dat") greyed out or something? All I have to do is replace "*.dat" with "MyFileName.dat" and it saves.

follow these instructions

Ubuntu PPA

If you are an Ubuntu user and want to stay up-to-date on the latest daily
build automatically, you can install the PPA on your system:

sudo apt-add-repository ppa:dansmith/chirp-snapshots
sudo apt-get update
sudo apt-get install chirp-daily

34295. Using Chirp with Windows 7 Home Premium

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-23 01:12:12 UTC
From: Jeff Newton
Topic: 34295 Message: 34295

Has anyone used CHIRP with Windows 7 Home Premium? How stable is it with W7HP? If so, I'm considering getting the programming software to program my radio, but where do I need to go for the download of the software?

73's,

Jeff - KE7OUR

34298. RE: Baoclone: Programming utility for Baofeng radios

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-23 03:43:00 UTC
From: <serge@...>
Topic: 33801 Message: 34298

New version of baoclone is available:
http://wiki.baoclone.googlecode.com/git/files/baoclone-1.2.zip

Changes in this release:
* Added support for Yaesu FT-60R. More info here:
https://code.google.com/p/baoclone/wiki/YaesuFT60R
* Fixed bug for UV-5R and BF-888S: uninitialized parameters could lead to wrong channel modes.

I just came across this while getting caught up on reading Han's blog.
http://hamgear.wordpress.com/ (highly recommended)

Baoclone is a utility for programming Baofeng radios via a serial or USB programming cable.
Supported radios:
- Baofeng UV-5R family (http://uv5r.net/)
- Baofeng UV-B5, UV-B6
(http://hamgear.wordpress.com/2012/12/18/review-baofeng-uv-b5-baofeng-uv-b6/)
- Baofeng BF-666S, BF-777S, BF-888S (http://hamgear.wordpress.com/2012/08/11/review-baofeng-bf-666s-bf-777s-bf-888s-and-look-alikes/)
Works with Windows, Linux and Mac OS X.

https://code.google.com/p/baoclone/

Check it out.

No its not greyed out but you simply cannot type in there. click on it and the courser doesn't go there... yes ive made it save but only by creating a blank text file in the data directory and calling it "mysetup.dat" from windows explorer.. now when I save there is a file name already in the large window for me to click on... it works

>Martin,

Correct. The "save as" has never worked with either the Baofeng CPS or VIP software for the UV-5R.

How do you mean you get and "unusable dialogue box" when selecting "save"? Is the "Save File" box (where it has "*.dat") greyed out or something? All I have to do is replace "*.dat" with "MyFileName.dat" and it saves.

There are several on YouTube already, but would be nice if someone from the list could put one up for the nice and easy way to program the radio, not by the programming software but by hand as well.

Had a VX6R a few years ago, lovely radio but it's not cheap and do you really need 6mtrs? If not then the UV5R is almost as good and a hell of a lot cheaper.

Martin - I don't really "need" 6mtrs but what I do need is the memory banks (groups). I've gotten some good feedback in this group - and being so knew I'm still learning the ropes.

But since the radio is not certified for GMRS, FRS or MURS, doing so would also be illegal.

Or have a friend who has an amateur radio license. I hear some ham's are actually friendly that way. ;-) lol

I bought a subscription to HamTestOnline for extra class and have to say I really liked it. Fast and easy to learn. Its a little light on info but that is what Google is for. :-) I got to the point where I had seen the questions so many times I knew the answers by memory. I really wanted to flush the rust out of my brain and have re-educated myself/memorized the math formulas. I would get to a question I knew the answer to, if my answer didn't match I knew I did the calculations wrong. :-). Or if you only want to pass the test you could stop once you have them memorized.

Then I asked the wife if she would be interested in the general class subscription. Its good for two years so she can use it later after a college degree she is just finishing. Yeah I then asked if she "really" wanted the general class license. As anyone who knows women they will do things just to please their man. :-) So now we have a subscription to the general class material.

Anyone wanting a quick and easier way to study check out HamTestOnline

I know, as long as they stay off the ham bands, you don't care where they illegally use these radios???

P.S. FYI Congress never pass a law against it. Congress did differ some of its power to the FCC. That according to the highest law of the land aka "the Constitution", IS Illegal! The FCC made a rule/regulation. The FCC is unelected. We are supposed to have Laws made by people that are elected not regulations made by unelected bureaucrats. That IS law without representation... something we had a revolution over. Now please redirect your energy to congress and the federal govt where "actual Laws" have been and are continually being broken.

To all Newbies that think the GMRS FRS discussion is something new, it is not. It has been beat to death. No one cares about your opinion as a Frequency police. Those that have been hear more than a month have heard whining about It's Illegal, the Radio Cops are going to get you and lock you up.
Go whine somewhere else.

HV

Law? The FCC can not pass laws. They do pass rules and regulations that have the effect of laws. Where in the constitution is the part about the FCC again? I can't seem to find it anymore. It must be there, I mean fallible power drunk men wouldn't do anything wrong would they.

In further news the EPA is passing regulations that are shutting down coal mines. The elected Congress decided not to pass similar laws but the unelected politically connected bureaucrats did an end run around our elected representatives. Or is that non-representing representatives?

Besides if the FCC doesn't care much why should we.

>in my opinion, though technicaly a grey area, the radio though not certified does comply with MURS requirements in the law. MURS allows detachable antennas and a wattage up to 30 watts pep . Also there are devices that though ar enot certified for MURS are grandfathered in to being able to use those freqa. Unfortunetly the baofeng radios are not one of those as they were produced after the laws cut off date. though i cant condone breking the law if your gona do it at least use the MURS freqa and stay off FMRS and GMRS and not use any additional amplification devices.

From: Loureiro, Antonio
Topic: 6410 Message: 34327

I got my doctor degree on the illegality of those uses on my very first day on this list…. I'd say one out of 10 emails is about the very same thing……. And the police is always alert and, guess, replies…..boring.

Antonio E Loureiro

To all Newbies that think the GMRS FRS discussion is something new, it is not. It has been beat to death. No one cares about your opinion as a Frequency police. Those that have been hear more than a month have heard whining about It's Illegal, the Radio Cops are going to get you and lock you up.
Go whine somewhere else.

HV

Of course, I care, but it's not an appropriate discussion for this group:

Go read Item Number 5 on the group home page:

"5. PLEASE also no discussion of LEGALITY of this radio for FRS, GMRS,
etc operation and FCC part acceptance for part 95 etc. This radio is NOT
approved for that use, but it is USA legal for commercial. amateur band
and any use as a receiver. Old, very stale topic."

and the next one says:

"6. DON'T FEED THE TROLLS who bring up these topics. Just ignore it."

I didn't ignore Gary's post, and I apologize to the group for that.

73, Jim K5JG

:)

I usually make my point and then shut up! Also not a radio cop, just feel the new, uninformed need to hear the truth. Then they can decide what is right from wrong.

Not likely, since they will say it's a problem with the users browser or something equally useless, when it's their new user interface that's the problem.

First off , thanks for the Group!

Ok I already own the UV-3R but decided to wait for this radio to come out.
I've been able to program all of my regular Frequencies with Chirp.
I've been reading all of the new user docs and other interesting information.
i was hoping to use the newer version of CHIRP to be able to include the 220mhz Freqs just for RX purposes.
But I have tried all the suggested mods. I'm assuming that this Version of the UV-5RAX+ will not do the out of band coverage for 220. I'm wondering if anyone else has run in to this issue as well.
Love the radio so far it seems to work really well. I'm waiting more information about which antenna would be the best one to purchase to replace the stock one.
Thanks!

I don't believe the UV-5RAX+ model was ever able to do 220MHZ.

If we look at the rf chip docs, its capabile, however the external parts needed for 220 specific freq may be missing. you might get receive at low sensitivity and low level tx output, but now full power. they were pretty specific when they built this radio to restrict the 220 not 220 via the hw design. If they added some soft switches to enable tri band components it might work. if you order a replacement RF chip, setup with arduino or similar I2C up, then build using their RF spec, the external amps and filters, that should work. Who knows maybe they will add this and AM/SSB modes. Remember this was a cheap single chip radio. Not a VRX7 or similar. K7BIT 73's.

If I were going to do that I'd just buy a 12V battery and a float a charger on it. Like many ham shacks do for their operating power.

That gives you emergency backup too for days and costs about the same as the Pyramid.

Something like a PS-1250 F1 *(5 Amp hr which is) which I have used for other projects. Or get a slightly larger battery and then you can charge your radio battery from the floater too….even more emergency capability. Since the UV-5R batteries are 1.8Ah and 3.8Ah I wouldn't charge them from a 5Ah battery….maybe a 10Ah in that case.

http://www.amazon.com/PS-1250-F1-Volt-Replacement-Battery-Terminal/dp/B007T6QR6O

And a CM1A charger for example:

http://www.impactbattery.com/schauer-cm1a-battery-tender-jr-charger.html?gclid=COeFoqH_2bkCFbE7MgodtxgAgg

Then add a cig lighter socket so you can plug in your eliminator.

Hello folks,

I have been doing a little research, trying to find a good power supply that I can use indoors with the battery eliminator in order to use the UV-5R as a base station. I found one recommendation for the Pyramid PS9KX 5A/7A however this particular supply seems to have gotten some really crummy reviews.

Can someone please recommend a decent supply that I could use that would serve this purpose (using the UV-5R with the battery eliminator indoors)?

Thank you for the assistance.

I ran a reasonably unscientific test the other day: I fully charged the (standard 1800mAh) battery, turned the unit on, and ran it till it was out. With about 5 minutes of transmitting and probably over an hour of receiving, it almost made it 24 hours.

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

Depends completely on how you use it.
I just ran a test and these are my results on my UV-5R.
An interesting result is when I threw on the MFJ-1714S the power consumption dropped considerably. So the antenna does have an effect on power consumption.
And the MFJ didn’t show as big a drop which I think is due to the heat dissipation being better as it has a good bit of metal at the base of the antenna.

The resulting formula for the stock antenna should be approximately:

B = Battery capacity in amps
D = duty cycle rag chew percentage (i.e. 50% = 0.5)
H = hours

H = B/((D*.5*2.642) + (D*.5*.129) + ((1-D)*.044))

So this D value above is the % time you are chatting with someone on your radio as opposed to just transmitting as the battery consumption is different. I think this is the best way to estimate typical usage of this radio.

For receive only this simplifies to this where D is the % time in receive mode:
H = B/((D*.129)+((1-D)*0.44))

Mike W9MDB

Here’s a chart for you

And here’s my power consumption tests:

What’s your source for cheap/rechargeable lantern batteries?

A quick search shows ~$16-$20 each or ~$32-$40 to get 12V worth.

You’re talking 5AH and you can buy a PS-1250-F1 12V 5AH for ~$18 shipped to your door.

Alex,

Baofeng has a department that will provide customized radio models if the radio dealer purchases a large enough quantity. Most of the time, this has been for variations in the case style and has resulted in many combinations of letters and symbols tacked on after the UV-5R (A, B, C, E, UU, +, Plus and so on). Then a lot of the ads on eBay, Amazon and elsewhere attempt to bill the radios as being "improved", the "latest" and "new of 201x". But they are all basically the same electronics inside.

Eventually a radio dealer had Baofeng create a UV-5R with customized firmware specifically for them. That radio was called the F-11. The latest version has the unique capability of having the VFO/MR button disabled by software.

Another dealer decided that he wanted to offer a 144/220 radio version of the UV-5R. Baofeng manufactured a radio with the necessary components changed to allow this. These radios are the UV-5RAX and the UV-5RCX.

Eventually another dealer (unrelated to the dealer with the 144/220 model) had a quantity of radios made with the original VHF/UHF electronics and for whatever reason had them badged as the UV-5RAX+. Someone knowing about the

UV-5RAX could easily think this radio is an improved version of the 144/220 radio, but the RAX+, despite the similarity of its model number to the RAX, will not operate on the 220 band.

With CHIRP, you can adjust the band limits from 1 MHz to 1000 MHz. This will allow you to key in any frequency from 100 MHz to 999.9975 MHz into the VFO. You can even manually program the displayed frequency into a memory channel (I just programmed 222.200 into channel 9 to verify this). But don't expect it to work. No matter what the display shows, I have never seen or heard of a mod that has been verified to work on frequencies much outside of the published specs of the UV-5R.

I should have included a table with my graph since it seems yahoo doesn't keep pictures.

But your test jives with this. You're talking ~4% duty cycle but very little transmit. That means you'd do better than the 18.4 hours of rag chew which you did.

YMMV is quite appropriate for battery use.

This is the approximate rag chew duty cycle hours of operation…note the chart here goes up to 50%...not a good idea with this radio.

I think it was noted before that volume does matter (thanks to Xaun for pointing that out) on receive along with the type of audio (high audio levels draw higher power in addition to just the overall volume)….this test was done with what was "normal" audio to my ear in a quiet environment and the same volume that I would have on my ear piece in a quiet environment.

Higher volume and you'd have to increase the 0.44 number in the formula as it draws more power during receive. If I had an o-scope I'd measure the volume. It's on my Christmas list.

If I re-do my formula to allow for your type of testing I get this:

B = Battery capacity in amps

X = Transmit hours

R = Receive hours

T = Total hours (i.e. including X & R)

H = B/(X*2.642 + R*.129 + (T-X-R)*.044)*T

If you increase the receive amps to .063 you get 24 hours for your example. So we're in the same ball park within a factor of 2 or so. My .044 value is probably the minimum volume one would use on the speaker so .063 is a reasonable value too.

To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] RE: battery question

I ran a reasonably unscientific test the other day: I fully charged the (standard 1800mAh) battery, turned the unit on, and ran it till it was out. With about 5 minutes of transmitting and probably over an hour of receiving, it almost made it 24 hours.

---In baofeng_uv5r@yahoogroups.com, <mdblack98@...> wrote:

Depends completely on how you use it.

I just ran a test and these are my results on my UV-5R.

An interesting result is when I threw on the MFJ-1714S the power consumption dropped considerably. So the antenna does have an effect on power consumption.

And the MFJ didn't show as big a drop which I think is due to the heat dissipation being better as it has a good bit of metal at the base of the antenna.

The resulting formula for the stock antenna should be approximately:

B = Battery capacity in amps

D = duty cycle rag chew percentage (i.e. 50% = 0.5)

H = hours

H = B/((D*.5*2.642) + (D*.5*.129) + ((1-D)*.044))

So this D value above is the % time you are chatting with someone on your radio as opposed to just transmitting as the battery consumption is different. I think this is the best way to estimate typical usage of this radio.

For receive only this simplifies to this where D is the % time in receive mode:

H = B/((D*.129)+((1-D)*0.44))

Mike W9MDB

Here’s a chart for you

And here’s my power consumption tests:

You “Can’t use any of the groups on Yahoo” – yet, here you are. Any, since you posted both your messages from Yahoo Groups (not via email or webmail), obviously you ARE USING Yahoo Groups.

This group isn’t for advice about how to operate your own computer and browser, but if you would tell us what you are actually doing and what is actually happening, perhaps someone could help tell you what is wrong with your setup or the way you are using it. (And, YES, the problem IS at your end, because other people are not having any such problem)

Greetings. I have both a UV-5R and a UV-B5. The UV-B5 is the same as a UV-B6 except it has a rotary encoder instead of the flashlight.

The UV-B5 definitely has a better front end and is much better at rejecting adjacent channel interference. Other than that, I prefer the UV-5R over the UV-B5 for almost everything else.

So if you are plagued by interference on the existing UV-5R, then you should consider the UV-B6. If not, then I would recommend another UV-5R or maybe even taking a look at the UV-82.

Topic: 34337 Message: 34369

The UV-5RAX+ is only a UV-5RA, nothing special ,, it's just that a dealer paid the $87 to have it own branded and again confused a bunch of people in the process

We here at Radio -Mart are the ONLY company to have a 144/220 model and we named it the UV-5RAX and UV-5RCX

We are working to have the new UV-82 made for 144/220 use as well and to be unique to our company.

I hope this clears up the continued confusion.

So if you want a 144/220 model were always happy to help

Best 73s

Ya yahoo is all screwed up. it has NEO ized all of its members and groups
and allot of groups and people are leaving yahoo because of it.

SAY NO TO NEO TELL YAHOO TO GIVE US CLASSIC BACK.

The UV-82 is a completely different case style. This make the charging cradle unique to the UV-82. As far as I know, only the standard size replacement battery is currently available. I've not seen any AAA or AA cases offered for it either.

The antenna port and speaker/mic port are the same so those accessories are the same.

Which is stupid because you'll find more CW around 28.000 then in the phone portion, but, yes, you can use CW almost anywhere. (watch for strange rules on 220)

34382. Re: [baofeng_uv5r] varying squelch trail length

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-25 03:29:45 UTC
From: Xaun Loc
Topic: 34354 Message: 34382

If you are talking about the signal you receive from a repeater, your radio would have almost nothing to do with the length of the squelch tail

From: 06nleclair@...

I just noticed that the squelch trail length tends to be long at times with my uv-5r. Just curious if anybody else has this issue with their radio.

34384. Re: [baofeng_uv5r] CTCSS ET AL

Topic: 34336 Message: 34384

Umm, that changed a couple years back. CW, digital and SSB (Upper Sideband) are allowed now on 60 meters, and the power limit was raised too.

I can't string up any wire here so I'm limited to my 10 meter mobile and my echolink.
I've already stated what 2 meters is like around here.

34388. RE: varying squelch trail length

Yahoo group: baofeng_uv5r (2013-08 — 2013-11)
Date: 2013-09-25 09:14:17 UTC
From: <rock.unroe@...>
Topic: 34354 Message: 34388

Unless you are using a repeater that provides squelch tail elimination (most ham repeaters don't), it is recommended that you set menu 35 (STE) and menu 36 (RP-STE) to OFF using the keypad or your programming software. Doing this will provide the quickest transition from transmit to receive when the [PTT] button is released.

Jim KC9HI

---In baofeng_uv5r@yahoogroups.com, <06nleclair@gmail.com> wrote:

I just noticed that the squelch trail length tends to be long at times with my uv-5r. Just curious if anybody else has this issue with their radio.

34390. RE: [baofeng_uv5r] uv 5r vs uv b6

Topic: 34360 Message: 34390

Tavinho, o UV 5 é o mais recente, com software mais novo e com mais possibilidades. A produção Baofeng NÃO segue nenhuma lógica do tipo 6 é maior que 5 e então mais recente. Pelo contrário, se não me engano o 6 é mais antigo e com menos funcionalidades.
Outro ponto é que as diferentes versões do 5 não são importantes. Elas na verdade se referem apenas ao externo do rádio, aonde estão os botões etc. O hardware e o software em si, nada muda.
Espero ter ajudade. abs

I wasn't talking about the signal I receive from a repeater, it's the squelch trail of the radio itself. I do have STE and RP-STE set to off. Thanks for the help.

Hi Folks, I tried to search this problem on this site but when I get a match I click on it and the yahoo group program puts me into the reply...I really hate the new Group format!

Anyway here is my problem-I have my UV-5R+ conntected to the optional BoaFeng12 volt cig adapter in my car. The radio is connected to a standard 2 meter mag mount antenna. When I first connect into the local repeater, I get a full signal - no noise but after about 1 minute of talking the noise level goes up and the signal goes down to the point my signal get lost into the repeater. I am only a few miles away from the repeater and the repeater antenna is over 100 ft up in the air. I read over the various menu notes on this site and seems the power is folding back. So I turned the SAVE option OFF and change the Transmit time TOT from 300 default to the highest number 600 as I recall.

Any suggestions?
Thanks
John KF5UMC

If I may ask, where did you get your cig adapter from? Have you taken it apart to see what’s inside? And I assume once you let it cool off it’s OK again for a while? So probably heat related?

Au contraire, mes amis.. CW is perfectly legal on 60 meters, although the RF carrier must be in the "center" of the channel. But you'd need a General class license or higher to operate on 60.

Thanks Jim,
I will be testing tonight with a known good fuly charge battery also I always run the radio on HIGH. Could be the battery eliminator too...I bought from ebay by the company that sold me the 2 radios...forget the name of the company at this time.

The UV5R has minimal air flow. Losing power is the way of your radio tell you It Can’t Breath :-)

Battery save ON will extend Battery Life when monitoring.
Try to keep your transmissions shorter to give the radio time to cool down. Increasing the TOT from 5 Minutes to 10 Minutes will only increase the problem.

Along with toasting the transmitter, too much heat will also make the LCD distort.

Subject: [baofeng_uv5r] Signal dorps off into the repeater

Hi Folks, I tried to search this problem on this site but when I get a match I click on it and the yahoo group program puts me into the reply...I really hate the new Group format!

Anyway here is my problem-I have my UV-5R+ conntected to the optional BoaFeng12 volt cig adapter in my car. The radio is connected to a standard 2 meter mag mount antenna. When I first connect into the local repeater, I get a full signal - no noise but after about 1 minute of talking the noise level goes up and the signal goes down to the point my signal get lost into the repeater. I am only a few miles away from the repeater and the repeater antenna is over 100 ft up in the air. I read over the various menu notes on this site and seems the power is folding back. So I turned the SAVE option OFF and change the Transmit time TOT from 300 default to the highest number 600 as I recall.

Any suggestions?
Thanks

The problem starts after a minute of talking...I guess you can say it cools down but that's because I stop transmitting and listen to someone else... however the radio is warm regardless of transmitting or not but not toasty...again I will just run with the default setting and on battery only and report back.
Thanks for the suggestions.

Hay, I found this on EBay recently. I've had pretty good luck ordering ultra-cheap UV-5R accessories from random Chinese vendors. Shipping can take a month, but I'm okay with that, since the stuff is generally ultra-cheap, and I am a cheapster:

http://www.ebay.com/itm/New-2-5mm-Car-Charger-Cable-for-BAOFENG-UV-5R-3800mAh-battery-BL-5L-/181176343056?pt=US_Radio_Comm_Device_Batteries_Chargers&hash=item2a2ef39a10

I have a couple of these extended batteries with charging port, so I've been following these threads. If I order one, I'll post some pictures of the inside electronics.

Yes, this what we were told which goes from Chinese to Chinese to English. Sometimes some important facts are left out in the process. However, they did say Radio-Mart was the only place for the 220 version in the UV5R case.

I will also add I ordered the Radio-Mart 220 mhz version and it works great. I did not have an issue programming the 220 repeaters in it either.

So those that want the 220 version you will need to get it from Radio-Mart which offers a good deal on them.

I'm still familiarizing myself with a new UV-5R variant, the BF-F9, and am scheduled for a "tech"-level class in early October followed by FCC testing, which I intend to follow with "general".

Meanwhile, my attempts to merely listen aren't producing any audio. I used radioreference.com to find the "Public Works" frequency of 156.0000 MHz in my area, and while there are occasional bursts of static on that frequency, I have yet to hear a human voice on my new radio on any selected frequency.

What am I doing wrong, please?

I use mine with the stock battery. I find that the power rolls back, but only after about 10 minutes of 50:50 TX/RX. The radio also becomes uncomfortably warm to hold, though at least on mine the display is fine. I use that as an excuse to end the QSO. Otherwise, I pull my Kenwood off the shelf. Others locally have remarked on similar heating issues. A battery eliminator would no doubt give you more power and heat.

Hi,
I purchased two different battery eliminators. One had a simple flat square of metal as a heat sink while the other had a real finned heat sink. I had the same problem with mine when I used the one with the flat metal. The 8 volt regulator chip heats up after a minute and shuts nearly off then turns back on. If you look at my thread on taking apart the battery eliminator you will see the whole story. I used my dummy load and a power meter to check mine out and it worked fine with the battery but always shut off after about a minute with the eliminator. You can carefully take the eliminator apart and put another regulator in parallel or put in a better heat sink. I used a repurposed one from an old PC.

There are many possibilities, including the possibility that your Public Works Department is no longer using 156.000 as their VHF frequency. Do you have TDR turned on or off? If off, and the 156.000 frequency is in the "off" VFO position, you'll never hear a thing.

Try a NOAA weather broadcast. 162.40, 162.500, 162.550. If the PW frequencies are AM or digital, you won't hear them. You can only get FM. You could also trying tuning in your local FM radio station.

Subject: [baofeng_uv5r] No reception?

I'm still familiarizing myself with a new UV-5R variant, the BF-F9, and am scheduled for a "tech"-level class in early October followed by FCC testing, which I intend to follow with "general".

Meanwhile, my attempts to merely listen aren't producing any audio. I used radioreference.com to find the "Public Works" frequency of 156.0000 MHz in my area, and while there are occasional bursts of static on that frequency, I have yet to hear a human voice on my new radio on any selected frequency.

What am I doing wrong, please?

> If RadioReference lists a PL tone or DPL code for the frequency you are wanting to listen to, ignore it. You would only need it for transmitting and you won't be doing that. Having a receive tone or code programmed on a channel were none is being transmitted will render your radio deaf on that channel.

Affirmative reception on NOAA Wx and local FM, so it's an operator issue, thank you.

Hi John -

It sounds to me that the antenna might be suspect. A poor match (or a partial short) might be causing the transmitter to fold back after a few transmissions. Suggest you test the antenna system, especially any connectors or cables that might be stressed as you use the radio.

Currently, Menu[7] TDR is "off" ... in VFO Mode 156.000 is displayed ...
not sure what is meant by '156.000 frequency is in the "off" VFO position'.
Does that meet with approval, or should TDR be "on"?

+++

If TDR is "off", the radio only listens to one VFO, so unless you have
"your" frequency programmed into the VFO that the radio is listening to,
you won't hear anything on your chosen frequency. The fix is either to
turn on TDR or make sure the radio is listening to the correct frequency on
the correct VFO position. Gobs of useful information is on the Miklor
website.

Well,
The ones that have the "real" heat sink and work have a sticker on them that looks exactly like a Baofeng battery. Obviously the case was simply repurposed. The other version which cuts out had no marking or sticker at all. The other difference is the good ones came in a plastic zip lock bag while the ones which cut out came in a small brown cardboard box.

Hi Folks,
I just ran on a fully charged battery that came with the radio and works fine now...seems the battery eliminator I bought - the one with no label but marked 014372 and came in a brown box- doesn't work for long. I bought this several months ago but never tested / used it till I needed it. Just goes to show check stuff out as soon as you get just in case you need to send it back!

I will buy the labeled version soon. Any suggestions on where to buy the GOOD one?

Thanks for all the help.

WHAT “squelch trail of the radio itself”?

Either we are not understanding what you mean or you don’t understand what the term “Squelch Tail” means (in this case, it seems that both apply)

From: 06nleclair@...

I wasn't talking about the signal I receive from a repeater, it's the squelch trail of the radio itself. I do have STE and RP-STE set to off. Thanks for the help.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

If you are talking about the signal you receive from a repeater, your radio would have almost nothing to do with the length of the squelch tail

From: 06nleclair@...

I just noticed that the squelch trail length tends to be long at times with my uv-5r. Just curious if anybody else has this issue with their radio.

THAT is a beautiful analogy -- and more accurate than most people realize.

Yahoo did "rearrange the furniture" which most of us found very annoying --
but it is "blind" who are tripping over things and screaming curses about
it. In this case, not those who are physically blind but rather those how
are mentally blind (too angry or just too lazy to bother reading the links
and drop-down menus to find where Yahoo put everything)

We won against them in 2010, Yes we did. And for one I am NO and I say it again NO Kid. Gosh I wish I was a kid again.My hubby and I will have been togather 21 years this Nov. And yes they do do this every few years but this one is different. They are violating the ADA, and allot of other issues. And there is a very very very large group that is standing up to it. Starting letter writing campaigns to investors and media. We are going to soon get some media attention about this if we have anything to do with it. Yahoo is also trying to shush us up and make us go away because we are starting to hurt there bottom line. So we have to step up our pace ever more.

Angi,

I think you are missing one very important point. Since Yahoo provides their services FREE OF CHARGE to you and the other millions of users, they are free to do whatever they want, including pull the plug, delete all of the data or block your access. There isn't anything you can do. The only loss is to their investors!

I see this

Nagoya Dual Band SMA UV Antenna
on Amazon...has anyone tried it? I am using a loaned 2m/440m magnet mount and thinking of getting this. I like the idea of not using my coax adapter cable as this cable comes with the SMA connector. Has anyone see this in the States- seems if I order it comes from Asia so more shipping/duty hassles!

http://www.amazon.com/Original-Antenna-UT-108UV-SMA-Female-wholesaler/dp/B00DTQ4A6M/ref=sr_1_54?ie=UTF8&qid=1380212714&sr=8-54&keywords=baofeng

It's cheaper on eBay: http://tinyurl.com/nagoya-0

The UT-108UV I ordered has a different coil configuration: http://tinyurl.com/nagoya-1

It's expected to arrive mid-to-late October. In the U.S., the only problems I've had with shipments from Asia is "time", but many times it's been as little as two weeks with free shipping.

Thank you Ray for your excellent information.

It appears that there's no real traffic on that particular repeater, but that's fine. I've gotten some other reception on the radio and realize that things are working properly.

There's a construction crew laying fiber-optic cable in th neighborhood, and a little research showed me the frequencies used by both the crew (151.475 MHz) and the traffic control (Motorola TalkAbout Ch. 6, 462.6875 MHz).

I've got the the VHF in "A" and the UHF in "B" with dual monitoring, and things are working well. Those traffic flaggers are sometimes making comments about drivers that one would bet they'd not want known. ;-)

I will stay with e-bay. The main thing here is gaining all o the have 2.5/3 DBi so really make no sense now if you are looking for quality diamond have one same price on ebay same specs.

No on another issue: how I can re-size the baofeng software windows I can't see all the parameters no matter what resolution I get the screen to.

One can "maximize" the chirp window, reduce the screen font size, manually reduce the column widths (grab and drag column heading borders), View ->"Hide Unused Fields" or simply use the scroll bars.

I just received my new and first Baofeng radio this week for Amazon.com along with the optional software/program cable. It is badged as UV-5RAX+; and is for 2 and 440. Using my Win7 computer, I don't believe the software disc has the required software on it for this radio. Also, I am unable to load the require USB cable driver. Otherwise, the radio seems to function okay up to this point. I am happy, too, for the info here and on YouTube regarding this radio. 73, Karl, KO8S

Really? I found most things in very inconvenient places, and can't find some things I used regularly on my mobile device because they aren't there in the new mobile interface, by Yahoo's own admission. And others have been unable to do some things AT ALL until very recently and are still missing things that are critical to how they use their groups. Also, didn't it ever occur to you that maybe visually impaired people use computers with the aid of screen reading software, and that this new interface might not be compatible with that? Or that people with physical impairments may not enjoy having to make excessive movements to accomplish simple tasks? Or that that nice clean white page may cause visual discomfort for people with light-sensitive eyes?

Win 7 was a problem with their sw however Win 8 when app is run with administrator and XPSP3 works just fine. You can program all the features of the radio including the memories. Chirp also works but has less features mostly memories.

Nice little radio.

Hi,

My beloved Baofeng has just broken, tried to get it repaired but the boards and components are so small that it's a write off.

I know that this is a Baofeng forum but I want to go the next level up, I've seen a

WOUXUN KG-UV6D Dual Band 136-174/400-480Mhz FM Radio for about $100 USD but I can't work out why it's nearly double the price of the Boafeng

If anyone could explain or recommend another hand held transceiver I'd be grateful

Using it to try and connect to some local repeater in my area and just transmit on the PMR 446 frequencies, sometimes I do some walking out in the Scottish Highlands so its also useful as an emergency tool in places where I can't get a signal.

Another use would be just scanning the frequencies listening in. I'm not sure why the Wouxun is nearly three times more expensive than the Boafeng? Don't see what extras you get at all

The Wouxun came out first, then the Baofeng. The Wouxun has 5 watts, most of the Baofengs have 4. The Wouxun feels a little more sturdy. Same accessories work for each except the batteries. Both manuals suck, I think the Baofeng is worse. Wouxun easier to program, but not by much. I have 2 of each brand. Like them both.

It depends. My primary HT these days is an Alinco DJ-G7. It was worth what
I paid for it because TX and RX is that much better than the Baofengs and
other radios I have. That radio was 5-8x the cost. I just wish I could
get a 3800mAh battery for it.

I have and mostly use a Quansheng TG-UV2. It has a little wider receive selection than the Baofeng UV-5R and Wouxuns. Its scannig ability is much better than the Baofeng too, but still far short of a true scanning radio. They go for around $92 US FOB from Hong Kong or China. Chirp does not support it, yet, but the Yahoo group has useful spreadsheets to work with the factory software. It takes the same accessories as the Baofeng.

I have both the UV-5R and KG-UV6D. I like the Wouxun better. My belt is 1-1/2" wide, the Baofeng's belt clip hangs up on the belt making it hard to remove quickly, with the Wouxun this issue doesn't exist. Also the Wouxun has a VFO knob. While this isn't an issue for most, it is for me. And the Wouxun has 199 channels (use full when programming various combos). The battery charger for the Wouxun comes standard with charger connections for household current and 12VDC (or what ever you use in the UK). And lastly I like that I can set the Wouxun to display the top line of the display without seeing the bottom line and vice versa. The only issue I have is the built in flashlight, I have no need for it. I'm left handed and when putting the radio on my belt it is easy to tap the button that turns the flashlight on. Nothing light walking around out in public with it turned on.

My UV6D cost $150. I got one with the 2.5k step. While I don't need it now, one never knows what the future might bring. Also, I purchased mine from a local distributor which was good as the first one was defective but easily replaced under warranty.

True the Wouxun doesn't have the option of a 3800mah battery o I purchased a few extra batteries.

I have added a few photos of the guts used in the no label battery eliminator... no physical damage but I noticed there is way too much grease between the regulator and heat sink interface, This can actually cause poor heat transfer. So I squeezed out the excess grease tightened up the nut and screw which was a bit too loose and see if that helps. Next I will try to determine the regulator part number and find a replacement and see what happens.
John

---In baofeng_uv5r@yahoogroups.com, <johnpnorth@...> wrote:

Hi Folks,
I just ran on a fully charged battery that came with the radio and works fine now...seems the battery eliminator I bought - the one with no label but marked 014372 and came in a brown box- doesn't work for long. I bought this several months ago but never tested / used it till I needed it. Just goes to show check stuff out as soon as you get just in case you need to send it back!

I will buy the labeled version soon. Any suggestions on where to buy the GOOD one?

Thanks for all the help.

Subject: [baofeng_uv5r] RE: Signal dorps off into the repeater

Well,

The ones that have the "real" heat sink and work have a sticker on them that looks exactly like a Baofeng battery. Obviously the case was simply repurposed. The other version which cuts out had no marking or sticker at all. The other difference is the good ones came in a plastic zip lock bag while the ones which cut out came in a small brown cardboard box.

---In baofeng_uv5r@yahoogroups.com, <asheville307@...> wrote:

Hi John -

It sounds to me that the antenna might be suspect. A poor match (or a partial short) might be causing the transmitter to fold back after a few transmissions. Suggest you test the antenna system, especially any connectors or cables that might be stressed as you use the radio.

John

On 9/25/2013 9:06 AM, johnpnorth@... wrote:

Hi Folks, I tried to search this problem on this site but when I get a match I click on it and the yahoo group program puts me into the reply...I really hate the new Group format!

Anyway here is my problem-I have my UV-5R+ conntected to the optional BoaFeng12 volt cig adapter in my car. The radio is connected to a standard 2 meter mag mount antenna. When I first connect into the local repeater, I get a full signal - no noise but after about 1 minute of talking the noise level goes up and the signal goes down to the point my signal get lost into the repeater. I am only a few miles away from the repeater and the repeater antenna is over 100 ft up in the air. I read over the various menu notes on this site and seems the power is folding back. So I turned the SAVE option OFF and change the Transmit time TOT from 300 default to the highest number 600 as I recall.

Any suggestions?
Thanks
John KF5UMC

Absolutely – having the battery in radio with the radio off is the same as the battery by itself.

That’s why they put the alignment slots on the battery and not on the radio.

I'm not sure if your post was a personal jab at me or not, but I will clarify nevertheless. At the end of transmission, I noticed that there is at times a long squelch trail on the receiver. I've experimented with several receivers including two scanners and another radio. Tightening up the squelch on those receivers had no effect which makes me suspect that it's the UV-5R, not any of my receivers.

Should have said squelch trail caused by the radio.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

Well, since the alternatives seem to be more expensive, you could just get another UV-5R. That would allow you to use the battery, antenna, charger, and other accessories with the new radio.

I'm not sure if your post was a personal jab at me or not, but I will clarify nevertheless. At the end of transmission, I noticed that there is at times a long squelch trail on the receiver. I've experimented with several receivers including two scanners and another radio. Tightening up the squelch on those receivers had no effect which makes me suspect that it's the UV-5R, not any of my receivers.

Should have said squelch trail caused by the radio.

I second the recommendation. The Quansheng TG-UV2 is a great little radio. It may lack some of the features of the amazing UV-5R, (for example the 2nd display is numeric only), but it has 200 channels which is a little more comfortable than 128, and has a far more robust front end. Battery life is amazing.

I keep a UV-5R in the family vehicles for emergencies, but if I have a chance to grab a radio in a SHTF situation, it will be the Quansheng.

If it’s that long I’d replace the radio. I just had one that was the opposite…took a second to open up squelch so you’d lose the beginning of a transmission.

Can you test UHF too? Just out of curiosity?

Dave,
After you pass the technician exam, ask (if it isn't already offered) to take the general test. The only cost to you should be your time and you have a 50/50 chance of passing. You might be lucky enough to walk away a general.
Good luck and 73,
Jim KC9HI

By any chance does anyone know of, or have, either a boafeng/Wouxan mobile unit? If so, how is it?

I am wanting to move up into the mobile world now and would like to get a good unit that I can learn on that is capable and that will last awhile.

If you have time to study spend $29 on HamTestOnline.com. I die for the extra class exam. It goes through the question pool and pushes any areas you are weak in. Miss a question and it repeats till you either know it or memorize it. There are math questions I know the answer too so if I don't do the calculations right or miss a step I will know I messed up. I could stop at knowing the answers but I really wanted to remember all the stuff I forgot over the years. :-). I will be taking my exams on the 28th of this month, tomorrow morning. I am studying today and tonight just to try and get 100% on all three exams. :-). Check out HamTestOnline. Try it free. Then pay for the entire pool of questions. If you can devote some time between now and your test I bet you pass the general. They also guarantee you will pass or you money back! How can you go wrong with that. I really like it for the speed and ease of learning. Its what you need to cram for your general exam. You don't need a perfect score, only 74%. :-)

Good luck
Smokin Paul

Baofeng doesn't make a mobile unit (yet), and this month's QST does a nice review of the dual band Anytone mobile. Wouxun also has a dual band mobile unit. If you don't need a dual band unit, you might want to look into a TYT mobile as well.

Be very careful. There are many variations of the KG-UV6D. Double check the frequency ranges. When I was looking for mine, the low priced ones didn't have 2.5 KHz (for that you want a KG-UV6D V2 -- sometimes called V2.5) or part 90 certification. But if you just want it for ham use, neither are necessary.

To get one with 2.5 KHz steps and certified for part 90 will cost more like $140.00. Here's an example:

http://www.mtcradio.com/wouxun-kg-uv6d-v2-dual-band-vhf-uhf-199-channel-handheld-commercial-radio-w-2-5-step/

If you were plagued with off-channel interference on the UV-5R, you will appreciate the KG-UV-6D. My UV-5R is useless are work. Nothing but interference from the computers and heavy equipment. The KG-UV6D V2 works fine. To me it was definitely worth the additional $100. It was also less than 1/3 of the cost of the Kenwood radios that they bought.

You can also get a better receiver by purchasing a UV-B5 or UV-B6. But it doesn't have 2.5 KHz steps and isn't certified for part 90 either.

I have the Baofeng UV-B5, Baofeng UV-5R and Wouxun KG-UV6D V2U and I personally rate them good, better and best in that order.

At $50 (or less), you'd be hard to beat a UV-5R, but for a couple bucks more I'd recommend the Baofeng B5 or B6 units (better receiver but fewer memories at only 99 vs. 128). Even better receiver with Wouxun units, and up to 199 memories, but yes the price is higher. It really all gets done to the performance you want and the price you're willing to pay to get it.

Great info, thank you everyone.

My next question is who do you trust to purchase this from and what mobile antenna would you all recommend for a 2013 Subaru Outback?

I heard something similar to this in the UV-82 group in the last week or so. Sounds backwards to me.

First, you would need to install 3 different software packages from Baofeng to program the UV-5R, the F-11 and the UV-82. Four if you use the VIP software for the UV-5R and have radios with pre- and post-BFB290 firmware. Also note that there is no VIP version for the F-11 and UV-82. With CHIRP, you only need 1 program.

The OEM software will only run on Windows. CHIRP will run on Windows, Linux and Mac OS.

CHIRP can program anything on its spreadsheet memories editor that the OEM software can program on its spreadsheet memories editor with the following differences.

TX Frequency:
OEM = must enter the TX frequency directly
CHIRP = uses Duplex and Offset to set simplex, repeater +, repeater -, split and TX inhibited

Channel Name length:
OEM = 6 characters
CHIRP = 7 characters

Channel Name character set:
OEM = UPPERCASE letters and numbers only
CHIRP = UPPERCASE letters and numbers plus !@#$%^&*()+-=[]:\";'<>?,./ and the space character

Here are some of the other settings differences

ANI ID length:
OEM = 3-5 DTMF characters
CHIRP 1-5 DTMF characters

edit Alarm code
OEM = not applicable
CHIRP = 1-3 DTMF characters

edit Power-on Message:
OEM = UPPERCASE letters and numbers only (VIP only)
CHIRP = UPPERCASE letters and numbers plus !@#$%^&*()+-=[]:\";'<>?,./ and
the space character

edit 6+Power-on Message:
OEM = not available
CHIRP = same as power on message

Band limits:
OEM VHF: between 136 MHz to 174 MHz (VIP only)
OEM UHF: between 400 MHz to 520 MHz (VIP only)
CHIRP VHF: between 1 MHz and 1000 MHz
CHIRP UHF: between 1 MHz and 1000 MHz

VFO Inhibit:
OEM = not available
CHIRP = by programming the VHF and UHF lower band limit higher than the
high band limit

Firmware message:
OEM = not available
CHIRP = shows all firmware versions

COM port range support (Windows):
OEM = COM1 - COM16
CHIRP = COM1 - COM256

COM port detection (Windows):
OEM = only on some versions (flashes if COM port not detected - locks up
computer until detection routine times out)
CHIRP = detects and displays only available ports

Language support:
OEM = Chinese/English and English only (dual language versions require
selecting English every time)
CHIRP = English, Polish, Italian, Dutch, German, Hungarian, Russian and
Portuguese (auto set based on the OS or can be overridden by the user)

Insert, delete, copy and paste channels:
OEM = not available
CHIRP = yes

Multiple tabs:
OEM = not available
CHIRP = yes

Import channels from RadioReference.com and other external sources:
OEM = not available
CHIRP = yes

Export/import to/from CSV file:
OEM = not available
CHIRP = yes

There are probably other differences that I can some up with but surely these are enough to show which software is short on features.

And lastly, CHIRP is actively being developed. If you can name something that the OEM software can do that CHIRP can't, you have a much greater chance of having that feature added by the CHIRP software developers than getting the Baofeng software developers to add a CHIRP feature that the OEM software can't do. And since CHIRP is open source, you can add features to it yourself.

From: Jardy Dawson

> I believe the software disc is only the cable driver, not any programming
> software.

Usually that is the case, but you cannot be sure because the is no particular disc that comes with the cables. Each seller makes their own disc, generally from a collection of crap found online. I have yet to see or hear of any vendor providing a disc that includes instructions (despite those instructions being easy enough to find and steal online). Generally the discs contain a dozen or so different older driver files for the Prolific USB-Serial conversion chip. Most of the discs lack any sort of organization, so the user is left to guess which driver file might be the one for his/her operating system.

We do know for a fact, that SOME of the discs have been infected with various viruses (apparently the seller's computer that was used to create the disc was infected!)

A few people have reported loading a driver found on the disc that came with their cable and having it actually work -- far more have reported being unable to find the correct driver on the disc or being unable to get the driver to load (no great surprise when the disc has no instructions and the driver files on many of the discs are not executable files).

So far it appears that the best uses for the disc that comes with most programming cables are:
1. A drink coaster
2. A rifle or pistol target
3. A Christmas ornament
4. Hang from a string to scare birds away from your garden

I’m still not following exactly what you mean...

Which radio is transmitting?
Which radio is receiving?
Is the transmission through a repeater or direct?
What band are you illegally transmitting on?

It seems that you are talking about transmitting with the UV-5R and listening with some other radio.

What is this “squelch trail” that you are talking about? Is it the quiet of a dead carrier or the white noise of an open squelch with no signal being received.

From: 06nleclair@gmail.com
Sent: Friday, September 27, 2013 11:35 AM
To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] RE: varying squelch trail length

I'm not sure if your post was a personal jab at me or not, but I will clarify nevertheless. At the end of transmission, I noticed that there is at times a long squelch trail on the receiver. I've experimented with several receivers including two scanners and another radio. Tightening up the squelch on those receivers had no effect which makes me suspect that it's the UV-5R, not any of my receivers.

Should have said squelch trail caused by the radio.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

WHAT “squelch trail of the radio itself”?

Either we are not understanding what you mean or you don’t understand what the term “Squelch Tail” means (in this case, it seems that both apply)

From: 06nleclair@...

I wasn't talking about the signal I receive from a repeater, it's the squelch trail of the radio itself. I do have STE and RP-STE set to off. Thanks for the help.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote:

If you are talking about the signal you receive from a repeater, your radio would have almost nothing to do with the length of the squelch tail

From: 06nleclair@...

I just noticed that the squelch trail length tends to be long at times with my uv-5r. Just curious if anybody else has this issue with their radio.

I have not seen or heard of any BaoFeng mobile yet.

I have the Wouxun KG-UV920P-A (the A is the America version) (the 920P is the version that replaced the original 920R (no one understands Chinese model numbers!))

It has some interesting features and capabilities - including Part 90 certification, but like the Chinese handhelds, it has issues with strange programming and operation compared to more familiar ham or commercial radios.

One limitation is that it is Narrow Band ONLY, everywhere outside the ham bands -- despite the fact that not quite all non-ham frequencies were included in the FCC's narrow band ruling.

The one REALLY SERIOUS FLAW is that the radio can scan memory channels, BUT THERE IS NO RECEIVE AUDIO WHILE SCANNING!!! The scan will stop on an active channel (and resume when the channel stops being active) but you have to take it out of scan mode to actually hear what it is receiving.

If the scan issue isn't a problem for you, this can be a decent radio at an almost reasonable price for a dual band mobile -- the price is not nearly as cheap as any of the Chinese dual band handhelds - for most people I would recommend either a new or used Alinco, Yaesu, Kenwood, or Icom rather than the Wouxun or Anytone mobile.

The Chinese companies need to cut the prices of their dual band mobiles by at least 30% before they will competitive on price given their quality and usability issues (cutting the price by 50% would make them the kind of bargain that the HTs are)

Hi everyone.

In the UK we have a magazine by the name of Radiouser. It is quite good as it covers things from SW, HF, CB. VHF, UHF and a lot more. In last month a guy had put an bit in about how BAD the user guide was for the UV-5R. So I sent the magazine a email telling them about the www.miklor.com/uv5r web site. Low and behold my email is in the October issue of the magazine. So you might be getting a few more users from the UK using that site.
Well that is all I have to tell you.

Bye from John in the UK

Try the Powerwerx.com mobile. I have 2 and they seem to be good radios. Dual band, dual monitor, 750 channels, speaker in the hand mic, crossband repeat. Not quite as easy to use as the Yaesu FT-8800, but close. $300.00 at HRO or Powerwerx.

Great advice.

> But if you just want it for ham use, neither are necessary.

2.5 KHz step size is likely to be needed for some new ham repeaters,
especially in the high density urban areas.

Not that many years ago no one "needed" 5 KHz step sizes on 2m or 440MHz --
now you need 5 KHz even out in the middle of nowhere.

It's more likely to be needed for Digital Voice modes like D-Star, DMR (usually Motorola MotoTRBO) or NXDN than FM Voice repeaters, though I suppose there might be some exceptions.

I see Baofeng UV-5R I also see a "PLUS" version, what is the choice radio currently? Doesn't seem like much difference in cost, just curious if there is a most current updated radio?

Thank You in advance for the help, I look forward to hanging out and learning alot here!!

Is the case better? I have read some people have issues with the other cases and compatibility with plugs, antennas, etc.. I am very easy on my stuff, thinking maybe the original is the way to go.

Did you order a programming cable? It requires software to program channels with TX inhibited.

If you did... then ignore any CD that is shipped with it. Get your driver and programming software from links on the Miklor.com website. Use the guide on the website to make sure the needed driver is installed.

If you haven't ordered one, you can make the cheapies work by installing the correct driver for the unauthorized chip that most of them have. It really isn't a big deal to do this but many have had hours and days of grief getting their programming cable working.

You might consider getting a programming cable with a genuine Prolific USB-to-Serial chip. Or for a few dollars more, you can get one with an FTDI based USB-to-Serial chip to avoid the Prolific problem (no pun intended) altogether. Both the genuine Prolific and FTDI based programming cables are available from the Three Old Crows General Store. It will be hard to locate a cable with a genuine chip elsewhere because most vendors don't say if their cables have genuine chips or not (they probably don't know one way or the other). The FTDI cable can be located elsewhere but most likely won't be any cheaper than TOCGS.

Another alternative is to make your own programming cable with a CP2102 USB-to-Serial chip. I made one for about $5 and had fun doing it. Pictures are in the group photo area and information about it is on the Miklor.com website.

Hi John
The regulator IC looks like it might be a 78 series. Check the IC temperature if you can while the transmitter is running. It is probably very hot. The 78 series regulators have an over temperature shut down protection.
You might want to increase the size of the heat sink, Make sure the IC is screwed tight to the heat sink with the minimum amount of thermal paste between the chip and heatsink. Some ventilation in the case may help get rid of the residual heat.
Keith ZL2TPQ

---In baofeng_uv5r@yahoogroups.com, <johnpnorth@...> wrote:

I have added a few photos of the guts used in the no label battery eliminator... no physical damage but I noticed there is way too much grease between the regulator and heat sink interface, This can actually cause poor heat transfer. So I squeezed out the excess grease tightened up the nut and screw which was a bit too loose and see if that helps. Next I will try to determine the regulator part number and find a replacement and see what happens.
John

---In baofeng_uv5r@yahoogroups.com, <johnpnorth@...> wrote:

Hi Folks,
I just ran on a fully charged battery that came with the radio and works fine now...seems the battery eliminator I bought - the one with no label but marked 014372 and came in a brown box- doesn't work for long. I bought this several months ago but never tested / used it till I needed it. Just goes to show check stuff out as soon as you get just in case you need to send it back!

I will buy the labeled version soon. Any suggestions on where to buy the GOOD one?

Thanks for all the help.

Subject: [baofeng_uv5r] RE: Signal dorps off into the repeater

Well,

The ones that have the "real" heat sink and work have a sticker on them that looks exactly like a Baofeng battery. Obviously the case was simply repurposed. The other version which cuts out had no marking or sticker at all. The other difference is the good ones came in a plastic zip lock bag while the ones which cut out came in a small brown cardboard box.

---In baofeng_uv5r@yahoogroups.com, <asheville307@...> wrote:

Hi John -

It sounds to me that the antenna might be suspect. A poor match (or a partial short) might be causing the transmitter to fold back after a few transmissions. Suggest you test the antenna system, especially any connectors or cables that might be stressed as you use the radio.

John
AC4JK

On 9/25/2013 9:06 AM, johnpnorth@... wrote:

Hi Folks, I tried to search this problem on this site but when I get a match I click on it and the yahoo group program puts me into the reply...I really hate the new Group format!

Anyway here is my problem-I have my UV-5R+ conntected to the optional BoaFeng12 volt cig adapter in my car. The radio is connected to a standard 2 meter mag mount antenna. When I first connect into the local repeater, I get a full signal - no noise but after about 1 minute of talking the noise level goes up and the signal goes down to the point my signal get lost into the repeater. I am only a few miles away from the repeater and the repeater antenna is over 100 ft up in the air. I read over the various menu notes on this site and seems the power is folding back. So I turned the SAVE option OFF and change the Transmit time TOT from 300 default to the highest number 600 as I recall.

Any suggestions?
Thanks
John KF5UMC

34514. I Passed Extra Class Exam

This morning in passed the Technician exam 34/35, the General 35/35 and finally the extra 49/50. :-) Only two wrong out of 120 questions. :-)

Anyone wanting to pass by learning or memorize I recommend HamTestOnline. Any questions you miss it brings back til you get them right. I got to the point where I knew the right answer from memorization so if I made a mistake in the math I could correct what I was doing til I got it right.

If all you wanted was to pass the exam you could just rely on memorization. Or like me, keep hammering away til you know and understand. I originally used it for the extra class. I liked it so much I bought the general to save time. My goal was to get a perfect score on all three tests. I'm pleased I came very close. :-)

Now its time to program my Baofeng HT's :-)

Get a subscription to hamtestonline and you'll be ready to pass in a week or two. It really pushes your weak areas. I started studying the tech and general around the 7th. I could get a passing score on the tech from the get go. Then aced it a couple of days later. I was working on the general when I discovered hamtestonline. I was worried about the extra so I started with that. It was so easy and quick that after mastering the extra in a few days I decided to get it for the general just so I could try for 100%. :-). Man oh man is that learning technique awesome. You miss a question it brings it back. Miss it again and it hammers you. :-) Easy peasy lemon squeezy! For real.

A background in electronics and being an IT network specialist really helps. Also I studied this stuff when I was a kid so I sort of had it already on the brain. Some stuff changed, some new and some forgotten. I could have studied and passed without using hamtestonline but it did make it so much easier and better. No way I would have aced the test like I did without it. :-)

I've found that 3 seconds in a microwave oven renders the disc to its
most usable format, a thing of (briefly, at least) beauty..

Hi,
I recently purchased one of these radios and I am delighted with it.
I am looking at spare batterys.
Can you charge up the bigger 3800mAh battery using the charger for the 1800mAh battery that came with the radio?
Or is a different charger required for the bigger battery?
thanks in advance.

tech is $25
General is $30
Extra is $35.

However they guarantee your satisfaction or that you will pass or your money back! Can't go wrong with that. I bought the extra and found it awesome. The subscription is good for two years so I bought the general to brush up quickly. I figure later this year when my wife finishes up her 2nd degree she can use it. It adapts to you learning what you are weak on. Should figure out and adapt to her after a bit. Sure it costs money but it will save you time. Isn't your time worth more? Mine is. And the cherry on the cake is you can ace the test with minimal effort. :-). I was thinking it was a waste but based on what people on the list said I figure what the heck, why not. Boy am I glad I went for it. :-)

This morning in passed the Technician exam 34/35, the General 35/35 and finally the extra 49/50. :-) Only two wrong out of 120 questions. :-)

Fabulous! Congratulations.

Now that you've learned how to pass a test, the real learning can begin. ;-)

Hi,
I recently purchased one of these radios and I am delighted with it.
I am looking at spare batterys.
Can you charge up the bigger 3800mAh battery using the charger for the 1800mAh battery that came with the radio?

...

As a new buyer, I will say yes. I purchased the 3800mAh along with the radio which included the 1800 mAh, and am "conditioning" both batteries with the stock charger. After three charges and two complete "dead" discharges with the 3800mAh, I've been monitoring (not trained or licensed yet for Tx) for two days, and am currently charging 2x for the 1800mAh.

No the real learning happened many years ago. I just had to call a code blue on some neurons. Hamtestonline made a great crash cart completed with defibrillator, adrenaline etc. You could learn the test if you wanted to. I am the type that really wants to know and never wants to forget. I always go for understanding and retention. Unfortunately if you don't use it you have a tendency to loose it. ;-) it does CME back quickly though. ;-)

I've had one foot into ham radio since I was a kid. I love SWL. I rebuilt a 1945 Halicrafters Super Defiant general coverage receiver back in about 1981. Built many radios including a couple of Short Wave radios. One was a regenerative design, the other a Heathkit super-heterodyne. I have a couple other Halicrafter receivers in picked up a few years ago. Love the old school tube radios. Growing up there was a retired radio/TV repairman in the neighborhood who schooled me in the tube side of electronics. I have a very old yet super fine tube tester I bought off of him, Mr Miller, that works way better than any tester I have ever seen. Sometimes low tech rules. :-)

"If all you wanted was to pass the exam you could just rely on memorization"

Exactly, in the past, one had to earn an Amateur Radio Novice, General, Advanced or Extra class license.

Today,it only takes a little bit of time / memorization...the only proof that is needed is to listen for the difference between Ham vs. CB talk, for 5 minutes.

Why you ask?

The US exists today, solely on debt (e.g. as of today, the debt is more than $18 Trillion).

Is that a lot of debt?

Well, that's 12 zeros after the decimal point. Now start counting to just 1 Trillion.
....it will take you nearly 32,000 years to count to just 1 Trillion.

If that's true , who would ever lend us more?

Simple, many countries that are broke too (e.g. Japan, UK, France etc.) who only borrow money to lend us.

Look up Ponzi schemes.

Well, I get it, but what about China.....don't they lend us money?

Yes, as long as we keep buying their junk!.

Then what?

Why do you think NASA is spending Billions of dollars every year to explore MARS?

Simple.....when China won't lend us any more money, we're hoping that to find Martians, that will.

.

Anyone wanting to pass by learning or memorize I recommend HamTestOnline. Any questions you miss it brings back til you get them right. I got to the point where I knew the right answer from memorization so if I made a mistake in the math I could correct what I was

doing til I got it right.

If all you wanted was to pass the exam you could just rely on memorization. Or like me, keep hammering away til you know and understand. I originally used it for the extra class. I liked it so much I bought the general to save time. My goal was to get a perfect score on all three tests. I'm pleased I came very close. :-)

Now its time to program my Baofeng HT's :-)

Way to go Paul.

Same charger can be used on both the 1800 mah and 3800 mah. It just takes longer to charge the larger battery.

In IT it is nothing but learning. :-). When I was a kid a usually got bad grades yet some things I was really good at. I thought I wasn't smart. They told me you are going to have a very hard time in Junior High. Great thing to tell a kid. Hey kid you suck and are going to fail. :-) funny now.

Funny thing was I did better. Hmm thats odd. Again I got good grades in things that interested me. Actually A's and B's.

Theni was told you're going on to high school, your grades are not good enough, you are going to have a very hard time in high school. Again telling a kid your going to fail just seems silly. In any case I got some great grades proving what geniuses the school staff was. Hahaha

Then it dawned on me. It wasn't that i was not smart. I was bored by not having a big enough challenge and some really boring teachers. :-) Those that can do. Those that can't teach. Turns out I actually love constant learning. I get bored if things stay the same. Like an adrenaline junkie I need stimulation. Only mental stimulation. Although I don't mind a little adrenaline rush from time to time. I'm a two stroke triple motorcycle addict, aka Smokin Paul. I smoke old school high performance two stroke motorcycles. ;-) I have soo many interests and hobbies there is no money left for drugs. LOL

A lot of learning is just attitude. Do you know the difference between ordeal and adventure? Attitude. :-)

Get yours straight and get whatever license you want. If you try and memorize answers to questions you do not understand it will be like remembering a string of numbers. It can be done but it may be harder than learning. If you learn a little bit about the questions and answers (even if you don't fully understand it) you will retain it easier and longer. That extra information doesn't overload your brain. The extra info is like the glue that helps you retain and retrieve the answers. Just Google things you don't understand. If you can't make any sense of it then memorize. But I bet you'll understand at least some of it and find yourself doing much better on the exam. If you find the subject boring and are like me it will seem like you're skating uphill. Still even then a little attitude can do wonders. :-)

I have to getmy technician license first, but I want to read it and LEARN it, not just study questions and answers. I want to KNOW the material and UNDERSTAND it.. any suggestions?

"tech is $25
General is $30
Extra is $35.

However they guarantee your satisfaction or that you will pass or your money back! Can't go wrong with that"

Amazing!!!!!!!!

With this and cheap VHF/UHF radios, expect many more CBers to enter ham radio.

10-4?

Find a local radio club and see if they offer classes.

Topic: 34546 Message: 34546

Hi-trying to get CHIRP software running. I had it going several times, then it gave me the blue screen of death. When I tried to reopen it, no-go. I've uninstalled, reinstalled to no avail...tried both the daily build and 0.3.1. I'm running Windows 7 Enterprise. The Task Manager shows CHIRP running in the Applications tab. The error message I get appears to be related to section headers, whatever they are. The Prolific chip and cable appear to be in good shape, with the correct driver version installed (backward revised to version 3.2.0.0), tho I'm not even getting to radio communication without the CHIRP application interface showing up (not even a task bar). Your feedback is appreciated.

```
CHIRP 0.3.1 on WinVista/7 (Python 2.7.2)

At 07:57 PM 09/28/2013, you wrote:
>Then it dawned on me. It wasn't that i was not smart. I was bored by
>not having a big enough challenge and some really boring teachers. :-)

I had that problem also.

>Those that can do. Those that can't teach.

Those that can't do or teach go into consulting.
Those that can't do or teach or consult go into politics.

>Turns out I actually love constant learning. I get bored if things
>stay the same.

Ditto.

Got into programming in 1970 when it was FORTRAN and COBOL on punch card decks. Actually explored renting a keypunch machine to have in my home.

Then in 1975 got my hands on a minicomputer - 4K of core and 2mhz CPU! A real computer that I didn't have to cycle card decks through a batch processing system or reserve block time on.

Then got my own minicomputer in 1978 - 16 K of core and a 4 MHz CPU. A real home computer - but it was 220v and I had to unplug the stove and plug the computer in. When I moved opt my parent's power bill dropped by 1/4 (about $20) but the winter gas (heating) bill went up 1/3 (about $15).

Then in 1982 I acquired a IBM PC-5150 (my 5th home computer). And there's a story (that I got from an IBM engineer) why the model number was 5150...

My biggest home programming project was a 7 port radio repeater controller with a 8xN (where N was 3-7) audio crosspoint matrix. It had 27,000 lines of Z80 assembly code. Took a ream and a half of paper to print a code listing and crossreference.

And I'm still learning at age 60+.
Current project is learning Java and Perl.

Mike

Yeah the Radio Relay League has a great book. You can also study as you learn the questions. HamTestOnline provided some material, some links which I read everyone. It was lacking so being lazy aka "work smarter not harder" I googled and discovered info on wiki and other places filled with very good info. You can actually learn a lot from searching and reading the WWW. It is after all the worlds knowledge at our finger tips.

What are you looking to learn? A good book on DC electronics followed by AC will give you a base to work from.

Do they still make those 50 in 1 and 100 in 1 kits with discrete components. You know the kits that come with a book and tons of stuff you can make buy connecting everything together with wire and spring clips?

If you can get one of those you could learn a lot.

Tell us more about your 5 slot 8 bit bus PC running at 4.77 MHz.

Then in 1982 I acquired a IBM PC-5150 (my 5th home computer).

And there's a story (that I got from an IBM engineer) why the
>model number was 5150...
>
>I had a PC2 with 640K, 2 floppies, a CGA and a 20 MB hard drive, the Seagate 225.

Radio club classes can be good or bad.

I have a friend and former co-worker who attended a class sponsored by his local club. It was something like 3 hours one evening each week for 6 or 8 weeks. When he came out of it, he passed his Tech and General on the first attempt, which is not uncommon. However, the best thing is, he learned the material. Not only did they teach the technical side and the rules & regs, they also taught operating procedures (what a concept!).

Unfortunately, there are some class sponsors around who hold a "cram" session on a Saturday, then have the class come back for a quick review and test on Sunday afternoon. In general, the people who get their license via a class of this format won't remember much once they take the test. In other words, the class teaches the test, not the material. I was in my local ham store early one week and observed a couple who'd just passed their tests in a weekend class come in to buy their first radio, an HT. The sales person asked them if they knew which radio they were interested in and they said no. Then he asked which bands they wanted to be able to operate on. Their response? "What's a band?"

The point is, a person should choose the class carefully, based on what he/she wants to achieve. Hopefully, everyone interested in getting their ticket will be able to find a class that teaches more than simply what's needed to pass the test.

Thank you, already tried that by following the path where the chirp.confic should exist...the chirp.config file, best I understand from my googling, appears to be a temporary file that exists only long enough to boot to desktop. It appears that that file, temporary as it is, isn't being created.

Please keep the answers coming.

Some people are just CBers that got lucky on a test. In our area, there was a YL net going on our local 2m repeater. One YL asked another what her call sign was. I have a call sign? was her response. I have also seen people who don't have a clue how to enter a freq in VFO mode. How can you call yourself a ham radio operator if you don't know how to operate your ham radio? Granted, it takes time to learn new radios, the Baofeng being a good example, but these are people that have been licensed for over 10 years. The prosecution rests.

To paraphrase a common response.it's not me.it's you..

Do you already have Python installed on your system?

You mentioned a python version.

Do you have PYTHONPATH defined in your environment?

Thank you for your reply Mike.

I was instructed to go to the CHIRP website and download the CHIRP application. I went here:

CHIRP is supported on Windows 2000/XP/Vista/7/8.
Note: Windows XP users may need to follow the instructions here<http://chirp.danplanet.com/projects/chirp/wiki/FAQ#I-get-application-configuration-is-incorrect-when-I-try-to-run-CHIRP> if you have trouble starting CHIRP.

* Windows installer: chirp-0.3.1-installer.exe<http://chirp.danplanet.com/download/0.3.1/chirp-0.3.1-installer.exe> (Recommended)
* Windows standalone: chirp-0.3.1-win32.zip<http://chirp.danplanet.com/download/0.3.1/chirp-0.3.1-win32.zip>
As recommended above, I used the installer.exe file. During installation I could see the files being installed.

I would assume the executable would load all necessary files, including Python. Do I need to also go fetch and install Python to make CHIRP work? The CHIRP desktop did open several times for me as I was trying to get the USB cable firmware updated...but after the Blue Screen it would not work.

Thanks, keep the ideas coming, I'm trying to google my way out of this at the same time.

No.you don't need to install python.

Open a command prompt and type "python" . you should get an error..i.e.
'python' not recognized as an internal or external command.

If you do have a python executable that's probably your problem.

Check your environment vars too for the PYTHONPATH.

Also.go read this and file your report with the CHIRP author unless you're comfortable trying to debug it yourself.

http://chirp.danplanet.com/projects/chirp/wiki/How_To_Report_Issues

Is your CHIRP.exe installed in C:\Program Files??

Did you install as administrator?

Mike W9MDB

P.S. I did find this reply

Tom and Shawn, thanks for your suggestions in getting Chirp going on my PC.

As a last resort, I copied the Chirp folder from the APPDATA location from

my laptop and pasted the whole folder over the same folder on the desktop

and guess what? It loaded! I imagine it had something to do with the

previously empty config file since the debug file is overwritten when Chirp

loads, but anyway, its now working!

Hi Mike-thanks again,

I have filed a bug report with CHIRP.

As far as I know I am the administrator on my home machine, as I install software all the time. I could verify how?

CHIRP is in C\Program Files (x86), the path chosen by the CHIRP application.

Python at cmd gives the error you mentioned.

Environment variables show no Python path.

thanks Jim, I did not order any cords yet, as anytime I see multiple options, and I don't KNOW what I want there is learning to be done. You just learned me. This is ALL brand new to me. I have alot of CB time and VHF Marine radio experience but no HAM. I am excited to get started, and felt this radio could be a great starting point to get into the hobby without breaking the bank and not knowing what I want. I unfortunately live behind a good size hill so we will see how reception is at the house. I am assuming I could rig this radio up as a mobile rig if I wanted to? (12v power, external antenna, external mic, etc)

Brian,

Did you order a programming cable? It requires software to program channels with TX inhibited.

If you did... then ignore any CD that is shipped with it. Get your driver and programming software from links on the Miklor.com (http://miklor.com/) website. Use the guide on the website to make sure the needed driver is installed.

If you haven't ordered one, you can make the cheapies work by installing the correct driver for the unauthorized chip that most of them have. It really isn't a big deal to do this but many have had hours and days of grief getting their programming cable working.

You might consider getting a programming cable with a genuine Prolific USB-to-Serial chip. Or for a few dollars more, you can get one with an FTDI based USB-to-Serial chip to avoid the Prolific problem (no pun intended) altogether. Both the genuine Prolific and FTDI based programming cables are available from the Three Old Crows General Store. It will be hard to locate a cable with a genuine chip elsewhere because most vendors don't say if their cables have genuine chips or not (they probably don't know one way or the other). The FTDI cable can be located elsewhere but most likely won't be any cheaper than TOCGS.

Another alternative is to make your own programming cable with a CP2102 USB-to-Serial chip. I made one for about $5 and had fun doing it. Pictures are in the group photo area and information about it is on the Miklor.com website.

A word of caution regarding the Baofeng and Wouxun batteries... Unlike nickel-based batteries, lithium-ion batteries do not like to be fully discharged. At worst, you can damage them so badly that they stop working all together.

High performance radios that employ lithium ion power usually have sophisticated battery-monitoring circuitry that shuts the radio down before reaching a discharge point that would damage the battery. Not sure about these Chinese radios.

Better to discharge lithium batteries somewhere between halfway and dead and then recharge. They like to be recharged often!

Enjoy,
-JK

You could have put 30 MB on that Seagate drive if you replaced the controller card with an RLL controller -- the ST-238 was really nothing but an ST-225 that was relabeled and tested at the higher density. Lots of us ran 225's in RLL mode back in the day.

That is excellent advice and worth reading again for emphasis.

Just for the record, the Baofeng does start complaining and then eventually shut down to prevent the Li-ion from draining out completely. Unfortunately, if left in that state, the radio may "wake up" intermittently as the threshold is regained by the "rested" battery. Hopefully that's inconsequential.

I like to know what's going on under the hood but to drive the car its unnecessary. However not knowing the rules of the road or what the idiot light is (whats a band) is something else.

I agree you need to know rules, regs and operation. Outside of that what's the point if someone is truly not interested. They are just going to forget anything they learned shortly after taking the exam.

You don't have to be a mechanic to drive the car. Yet you also wouldn't give a 12 year old the keys and tell em have a good time (CB).

Nothing wrong with learning the question pool. If you memorize the question pool not as good but I doubt that person is going to be building equipment or doing much other than 2 meter chit chat. How much do you really need to know to operate.

I was talking to a woman who's 4 1/2 year old grandson came over and wanted to talk to grandpa on the radio. She said you can't just talk on the radio, you have to know things. He said I know what to do. I don't remember the call sign off hand but the kid said Something like W9CP W9CP thisnis N9NAH. She let him make a third party call to grandpa. Kid picked up what he saw. He learned the procedures. As much as some people want to think amateur radio is rocket science, it most definitely is not.

I do see that after people get their license and start into amateur radio they tend to get more involved and start learning more and more.

With the way things are today, I get a little testy when someone trashes my profession.

I bought a 2 meter/70 centimeter whip from eBay. It is mounted to a heavy duty CB mount from a truck stop that I got over a decade ago through a hole I drilled about 24 inches back from the windshield. Inside the SO-256 has a 90 degree elbow to a 10 foot piece of coax running down the A-pillar to a SO-256 to SMA adapter. The Radio (Usually a Quansheng TG-UV2) clips to the door pull. I seldom use the 12 volt adapter. I don't have a database built on how much better it works, but is noticeable. FWIW; the vehicle is a 1982 Oldsmobile Custom Cruiser with the diesel engine. There is no ignition noise. However headliners from that era were notorious for disintegrating. It took a further beating installing my antennas. Working around headliners even if they are in good condition is usually a royal pain.

Are you a teacher? Actually I have also had some amazing teachers. My physics teacher was freaking awesome. What a disruptive kid acted up there was never a need to send him to the office. He would just say something witty that would embarrass the kid and after the 2nd or third disruption they were too embarrassed to act up. ;-) They even learned a little bit in his class.

I work on my own vehicles, so under the hood is important to me. If I am going to commit to doing something I want to understand it and do it to the best of my ability. I LOVE learning and ham seems like I can jump in with both feet and learn for a long time.

I like to know what's going on under the hood but to drive the car its unnecessary. However not knowing the rules of the road or what the idiot light is (whats a band) is something else.

I agree you need to know rules, regs and operation. Outside of that what's the point if someone is truly not interested. They are just going to forget anything they learned shortly after taking the exam.

You don't have to be a mechanic to drive the car. Yet you also wouldn't give a 12 year old the keys and tell em have a good time (CB).

Nothing wrong with learning the question pool. If you memorize the question pool not as good but I doubt that person is going to be building equipment or doing much other than 2 meter chit chat. How much do you really need to know to operate.

I was talking to a woman who's 4 1/2 year old grandson came over and wanted to talk to grandpa on the radio. She said you can't just talk on the radio, you have to know things. He said I know what to do. I don't remember the call sign off hand but the kid said Something like W9CP W9CP thisnis N9NAH. She let him make a third party call to grandpa. Kid picked up what he saw. He learned the procedures. As much as some people want to think amateur radio is rocket science, it most definitely is not.

I do see that after people get their license and start into amateur radio they tend to get more involved and start learning more and more.

Jim K5JG <k5jg@verizon.net> wrote:

Radio club classes can be good or bad.

I have a friend and former co-worker who attended a class sponsored by
his local club. It was something like 3 hours one evening each week for
6 or 8 weeks. When he came out of it, he passed his Tech and General on
the first attempt, which is not uncommon. However, the best thing is, he
learned the material. Not only did they teach the technical side and the
rules regs, they also taught operating procedures (what a concept!).

Unfortunately, there are some class sponsors around who hold a "cram" session on a Saturday, then have the class come back for a quick review and test on Sunday afternoon. In general, the people who get their license via a class of this format won't remember much once they take the test. In other words, the class teaches the test, not the material. I was in my local ham store early one week and observed a couple who'd just passed their tests in a weekend class come in to buy their first radio, an HT. The sales person asked them if they knew which radio they were interested in and they said no. Then he asked which bands they wanted to be able to operate on. Their response? "What's a band?"

The point is, a person should choose the class carefully, based on what he/she wants to achieve. Hopefully, everyone interested in getting their ticket will be able to find a class that teaches more than simply what's needed to pass the test.

If you mean teachers you can thank the teachers unions for that. Kids are graduating that can barely spell there name. They can't count change and some math is difficult for them. We spend a truck load of money on education yet we are churning out idiots. Teachers in unions with tenure are jot professionals, they are tradesmen. There are good teachers and more bad or mediocre teachers that never seem to get fired. The unions are not paid by the children so they never represent them. But they are paid to represent all teachers good or bad. Many teachers I talk to think they are somehow better than everyone else because of their job as a teacher. That's is a fantasy that does not exist in the real world. When i see the public schools start turning out students that actually deserve to graduate I'll start praising their accomplishment. What I see a badly failing schools that are Eclipse by the achievements of private schools. We have a private school here that wants to buy an abandoned school building. The public school system refused because the private school is immensely successful. We are about to pass a law so the public school can't sit on empty building and have to sell or dispose of abandoned building. Care seems to be the last thing unions do. BTW I'm in a union.

And some people who have already graduated don't know the correct usage
of the words their, there, and they're.

It's "their" name, not "there" name. You did spell it correctly, however. :)

You might not need to be a mechanic to drive a car, but you need to know where to put the ignition key, turn on the lights, turn signals, etc. like I tell people, "I don't have to know how to operate 'your ' radio, you do. You don't have to know how to operate 'my' radio, I do. Simple things like using vfo vs memory, simple manual programming so you don't need a computer to add 1 freq, etc. i am not asking for anyone to launch the space shuttle.

Yeah I WS expecting that. :-) When your argument does not hold up attack the messenger not the message. Lol. I see many inaccuracies while I am typing and more I miss as my smart phone spell check thinks is knows best. Large male fingers and strong hands that handle all size and weights of boxes make typing on a small screen keyboard problematic. You understood the message, perhaps next time you could address it. Am I writing a research paper or legal document. No. Yet out of all the inaccurate writing on the group/list...

If you could please take the emotion out and think logically you might come to a different conclusion.

I agree. But I see some who think newbies should be able to repair surface mount electronics with a switchblade and a fire stick. ;-) The way I see it is different strokes for different folks. However the very basics are a must. And if you do see a clueless doe in the headlights that doesn't know they have a call sign... omg, 8-(then we need to get them out the road and help them into the light. A bullet to the head is never appropriate.

Knowing John (W1AI) and his wife Christina (KT1NA), who went from zero to Extra in one day using John's Ham Test Online training, I'm sure they would both be happy to learn you are now such a convert, Paul (if you weren't already). We've been including John's HTO Technician's class training with many of our units for about a year now. I've yet to hear of a single person that's failed his or her test "if" they actually set aside a reasonable about of time to study.

My wife used her certificate (given to her from John himself) to upgrade to General Class and has already stated she wants to upgrade to Extra. John and Christina are both really nice folks and I enjoy working with them both to help bring more folks into the hobby. I don't know if the picture of Christina holding a UV-5R is still on their website, but John purchased that pre-programmed radio for her at last year's Scottsdale, AZ hamfest from me. I wish I had known of John's website when I was studying for my Extra, it certainly would have helped me get it sooner.

Yes, you can use any 5W HT as a mobile, but certainly having a 40-75W mobile radio is preferred, if for no other reasons than power output and receiver performance.

I always carry an HT in the Jeep as a backup (or for use when I walk away from it), but it really shines when I use the mobile radio set up as a cross-band repeater when I'm out in the back country. I once used an HT and my previous 4WD SUV to cross-band from down in the Grand Canyon to my wife's kitchen radio via NorthLink (a 70cm North to South AZ based mountaintop linked system), a distance of about 200 miles.

---In baofeng_uv5r@yahoogroups.com, <baofeng_uv5r@yahoogroups.com> wrote:

If you mean teachers you can thank the teachers unions for that. Kids are graduating that can barely spell there name. They can't count change and some math is difficult for them. We spend a truck load of money on education yet we are churning out idiots. Teachers in unions with tenure are jot professionals, they are tradesmen. There are good teachers and more bad or mediocre teachers that never seem to get fired. The unions are not paid by the children so they never represent them. But they are paid to represent all teachers good or bad. Many teachers I talk to think they are somehow better than everyone else because of their job as a teacher. That's is a fantasy that does not exist in the real world. When i see the public schools start turning out students that actually deserve to graduate I'll start praising their accomplishment. What I see a badly failing schools that are Eclipse by the achievements of private schools. We have a private school here that wants to buy an abandoned school building. The public school system refused because the private school is immensely successful. We are about to pass a law so the public school can't sit on empty building and have to sell or dispose of abandoned building. Care seems to be the last thing unions do. BTW I'm in a union.

I'm sure the relative placement has some effect on the radiation pattern. However since 11 meters is not all that resonate with 2 meter or 70 centimeters I don't expect a big effect on the pattern. In my set up the CB antenna is about 15 inches behind the 2 meter/70 centimeter antenna. What I need is the tools and time to test for how the patterns are affected by the other antennas.

I run online courses for Technician, General and Amateur Extra. Everybody who has completed a course not only passed the exam, but did so with high scores. For more information, send a quickie email to <n7rr@mail.com>. Note: I use a different email address for the courses. 73, Bruce Prior N7RR Yes, I spell my last name differently! It's an old family tradition! 8=))

I have to getmy technician license first, but I want to read it and LEARN it, not just study questions and answers. I want to KNOW the material and UNDERSTAND it.. any suggestions?

At 02:17 PM 09/29/2013, you wrote:

>If you mean teachers you can thank the teachers unions for that.
>Kids are graduating that can barely spell there name.

It's "their" name.

>They can't count change and some math is difficult for them.

When I used to run a Jack-In-The-Box it was common
that I would have to teach new employees how to count
out the change after a purchase.

But there was one thing that I noticed - 95% of those
that came from public schools had difficulty with simple
math problems (like figuring a 15% discount for any
uniformed police officer, sheriffs deputy or fireman)
where those that came from private schools - especially
Catholic schools - never had a problem (and were
amazed at those that did).

>We spend a truck load of money on education yet we are
>churning out idiots.

Politicians do not solve problems - they talk, then throw
our money at it and hope it solves itself.

Paul, congratulations!!

I passed the General (34/35) and Extra (43/50) on 9/24. I had intended to take the General on 9/14, but a hospital stay made that impractical.

I used the extra ten days to prepare for the Extra, using HamStudy.org, which was free. Their flashcards sound very much like what you used, as you are drilled repeatedly on questions you miss.

I would point out that subject matter that I ‘learned’ in high school and college that was not used soon and often, was quickly forgotten.

So whether I took local ham club courses (there were none available) or took trade or junior college electronics courses, the material would have been forgotten if not used regularly.

OTOH, I’ve bought 17 (so far, mostly ARRL) books on operations and antennas. I don’t ever see myself repairing or building gear. But I can learn what I need to know in my areas of interest.

In my case, at least, the amount retained after six months would not matter whether it was ‘learned’ or ‘memorized’.

Yes, I am. High school science. But I won't be after this year. I am going to retire at the end of the year. I don't like what I see happening in that field. I'm also tired of explaining my profession to yahoos who couldn't do my job, wouldn't do my job and complain about me doing my job without knowing a darn thing about it.. Not a union fan either. BTW, tenure is not a lifetime job. It gives a person the same rights as any other job. I'm not going to waste bandwidth on that particular topic. If anybody want to discuss that with me, use my call @ gmail.

At one time, a ham license required some technical expertise. The idea was to be able to fix your rig of something went wrong. With today's modern rigs with CPUs, surface mount devices, integrated circuits and such, it's a little hard to fix your own rig. But at least be able to tell if it is not working correctly. How many extra class license holders can solder a PL-259, much less solder? It's sad to hear on a repeater the most technical discussion being how to solder. At one time a ham license meant something but now....not so much. I do think that it should be more than just memorizing a set of test questions. I applaud anyone who gets a license and actually knows something about the technical side of the hobby. Just think, maybe cars would be better if cars were designed by engineers who actually worked on cars. Just my $0.02.

I've been fortunate enough to know a handful of skilled teachers over the years, and I agree with Paul there are many more needed if we are ever going to turn around the U.S. education system, but having said that, I can't imagine why anyone really skilled today would ever go into teaching, especially in the high school age brackets within most large U.S. cities.

The pay (usually) stinks, the class room sizes are (normally) too large, and the school systems are so frightened by the threat of parental lawsuits that discipline within (most) schools has all but disappeared. So teachers are left with thugs in the hallways, and many of them (particularly female teachers) are subject to threats and sadly all too often physical harm.

And that's not even including the wack-jobs that carry guns and knives into the schools on an almost daily basis. It's a joke to think that one police officer assigned to a campus of 400 (or more) kids can actually know what's going on several buildings away, or that they could respond in time to prevent most physical incidents from happening. Best case is that they will be able to fill out the paperwork report faster since they are already on campus.

Most homes today have either two working parents or (even worse) only one parent at home, leaving little time for the parent(s) to get themselves involved in the day to day events happening at school, or even to help the children with homework assignments. That leaves the school system (or even worse television, movies, or violent video games) to fill in much of the time with these kids.

None of this, of course, has anything to do with the Baofeng UV-5R radios, so unless we can all figure out a way to get kids interested in them early on, and get the schools to purchase them, I suggest we move on from the teaching subject.

Ah...is that suppose to show what is wrong with practice exams or a promotion for a particular "practice" exam?

1- Generally speaking, the longer the antenna the better. (Relative to your situation if you have 5000 foot peaks that have repeaters a small antenna will work fine, but if you need to talk on a simplex/direct frequency the longer the antenna the better.)

2- The largest horizontal ground plane available, the better. A horizontal ground plane is exactly that, a flat piece of metal or metal spikes going off in four directions from the base of an antenna.

3- The farther away from any existing vertical flat metal on the car, truck, or van the better.

4- Keep the antennas separated a foot (or even more) if possible. Keep VHF away from the stereo antenna. If you using a scanner (which does not transmit any RF), then that’s ok next to the stereo antenna.

5- Avoid bumper and license plate mounts if at all possible, there's simply way too much metal in their way at those levels for a good signal path (compared to the same antenna near the roof line).

6- DO NOT PUT YOUR ANTENNA BETWEEN THE TAIL GATE AND THE SPARE TIRE UNLESS YOU ARE REALLY PREPARED TO WORK ON GROUNDING. Normally that means getting under the vehicle and installing multiple ground straps to the back door, vehicle frame, bumper, etc., etc.

I'm an under the hood and into the engine kind of guy. I liked that his site gives some info but wish it offered more or more links. However google is just as good. I was going to get my old electronic books but Google was quicker and had some newer info. At times some interesting history info.

Getting the licence isn't the end all or be all of knowledge. Anyone curious will learn. Those that are not curious or motivated is likely not to care. Its the old leading a horse to water. Not everyone is the same and not everyone who drinks the water understands.

Politicians are merely statists who love big govt. It is the nature of govt and man. Everything that is happening today the founders saw coming. Bureaucracies grow, power concentrates, freedom and liberty suffer.

I always go for retention even though memory can and does fade. The best way to learn with the least effort is to repeat what you learned just at the point is of forgetting. The harder it is to retrieve/remember the better it is for long term retention.

Bob, the world has changed with much smarter devices and perhaps much dumber people because of it. I sent my kids to Catholic school but even they are going down in quality. :-(I tell my kids they don't have to outrun the bear just the public school graduates next to them. It used to be the majority of teachers were pretty good to great but sadly the culture has changed all that.
Imagine a kid showing up to math class today with a slide rule and a command of the subject. LOL

Their ;-) are a lot of paper tigers with the same degrees and certifications that do not, nor ever did, know much of anything. That hurts everyone working hard to improve themselves. However when you get the interview with someone that knows there ;-) stuff they will see in a heartbeat if you know anything. I once had an interview and was asked questions like what was my favorite animal. Wow. She had no psychology degree, just asked stupid questions. The other guy was rolling his eyes and containing himself at his colleagues ineptitude.

To the grammar Nazi's, had enough. :-) lol

>Yes, I am. High school science. But I won't be after this year. I am going to retire at the end of the year. I don't like what I see happening in that field. I'm also tired of explaining my profession to yahoos who couldn't do my job, wouldn't do my job and complain about me doing my job without knowing a darn thing about it.. Not a union fan either. BTW, tenure is not a lifetime job. It gives a person the same rights as any other job. I'm not going to waste bandwidth on that particular topic. If anybody want to discuss that with me, use my call @ gmail.
>
>At one time, a ham license required some technical expertise. The idea was to be able to fix your rig of something went wrong. With today's modern rigs with CPUs, surface mount devices, integrated circuits and such, it's a little hard to fix your own rig. But at least be able to tell if it is not working correctly. How many extra class license holders can solder a PL-259, much less solder? It's sad to hear on a repeater the most technical discussion being how to solder. At one time a ham license meant something but now....not so much. I do think that it should be more than just memorizing a set of test questions. I applaud anyone who gets a license and actually knows something about the technical side of the hobby. Just think, maybe cars would be better if cars were designed by engineers who actually worked on cars. Just my $0.02.

I heard Heathkit was coming back in 2011 but filed for bankruptcy the next year. Supposedly they are coming back in the near future. Found a few links.

http://en.m.wikipedia.org/wiki/Heathkit

http://heathkit.com/survey/index.php/278489/lang-en

I've built a few things with some surface mount components. I didn't use any special tools but it required care. At some point I should get some specialized tools to make it easier.

My wife who is not into electronics like I am had a job repairing automobile computer boards that were rejected. The people feeding the rolls of parts to the machines were your average factory workers. They were union and most didn't care enough to do their job right. Its a wonder anything made in America works right. Now production is in Mexico.

I really loved it when IC's came on the scene. So many more possibilities, so many cool things you could make.

At one time my oldest son was needing some discipline so I cut off the wifi aka his access to the internet. Shortly after my router started heating up and I was having trouble on one port. I opened it up to find a small Fonera router laying on top and wired into my wrt54 router. :-). He almost got away with it. If he would have disconnected the port, connected it to the Fonera's and found a way for it not to overheat I might not have noticed. LOL. With two devices competing for one port there were collisions like you get on a hub. He is very smart. Reminds me of me. :-)

You can still do mods and other work on smd boards. If you're careful its not that hard. Just slow going with normal soldering tools.

That reminds me of the Heathkit SW-717 shortwave radio I built as a kid. I gave it to a friend who gave it back about 15 years ago when it died. Its got a hum in the audio output. It should be sitting on a shelf in one of the closets. Now that I'm thinking about it I'll pull it out and fix it. Not as good as my 1945 Halicrafters but it was one I built. :-)

The capacitor can was not grounded well. My SW-717 is working again. :-)

Congratulations to all those who pass their exams.

It's amazing how this hobby has change over the years. I've been on it for the last 25 years, starting in CB. and other that are hams longer have seen many more changes.

The different points of view are all real, sadly. Unfortunately the teachers are more focused on getting the kids to pass FCAT, SAT etc than creating the foundation for great professionals. This is mostly on 2 things has pointed out on the posting:

1. Pressure from the politicians than are only interested in good results for more funding.
2. Teachers not interested in spending more time than necessary. (75% of teaching time is on teachers own time at home).

The other thing going on on this hobby is as pointed out also the "invasion" of microelectronics with the SMD's and integrated circuitry. BUT also we have another field that we need to improved and the basics for the exams are the starting point. WE NEED to at least learn how to build an emergency antenna and a lot of new hams don't know an don't care about this so we are getting a lot of chatting people who don't care about nothing else.

Yes we need to know what is a band, how to program our own radios manually, and the use of VFO's so we can survive an emergency, cells are not going to survive a hurricane or mayor natural disaster and is up to us to provided comms using the other side of this GREAT hobby: PUBLIC SERVICE

my problem with teachers today is that the schools seem to indoctrinate
kids to a certain worldview===they dont teach them how to think and arrive
at their own conclusions---critical thinking does not mean a person looks at
an issue in a questioning and analytical way, rather it means they view it
in
\a neo-leninist way---history has been replaced with so-called
"multi-cultural"
studies which trash, among other things, capitalism, caucasians and
tradition

in any event, in my studies im finding that the Extra and GROL have
basically
the same electronics which is my hard part---regulations come easy to me due
to my legal background--and i figure ill try to get a GROL too---just to
hang on
the wall

TNX for everyone's views

Since the federal dept of education was created there has been a steady decline in education. There is no reason the federal govt should be involved. Failing school is and was the obvious result.

Saying teachers are doing 75% of their work at home is pure BS. If its so bad then why don't they get a job doing something else? Because there is no other job the pays as well for so little work.

Full time pay for a job that gives you off holidays, snow days, the summer and they even throw in vacation and generous sick days. Add to that generous insurance, pensions, cadillac insurance and other benefits. Where in the real world would you find even half that. I am in a powerful union and even I don't get anything close. Here in my city the teachers get two (2) pensions! Oh those poor poor teachers... NOT.

If they are doing work at home its because they are wasting their time at work. Yeah I bet they are grading papers at home til their little fingers bleed. If you believe that I have a bridge to sell you.

Do you actually know any teachers? Are you familiar with their schedule outside of work? That is a rhetorical question, No you do not. If you were you would know what a load that 75% working at home is. Not even 5%. Just think about it. 8 hours work, 8 hours working at home and 8 hours sleep. Add it up. What are they grading, what great lesson plans are they creating. Why is their no results from this herculean effort? Why are school failing at an alarming rate? Once you had a lesson plan why would you need to spend time on it. Even tweaking it would only require very minimal (minutes) time.

Do not parrot the lies you are fed. If you don't know check out the facts, do some research. Slow down and think critically.

I sent my kids to private schools yet even in the private and Catholic schools you see the influence of social/communism. I taught my kids to think critically. Try to sell my kids any bs and you'll be skating up a very steep hill. They would come home and tell me things the teachers were saying in school. They were amazed at how many of the kids would just believe anything the teachers said without even a ghost of a thought as to what was actually being said. My kids would argue their side and also knew when it was a waste of time. They also knew it could get them a bad grade to go against some teachers propaganda. My daughter who is now a very good artist has the least critical thinking of all my kids. Yet you would even have a hard time pulling the wool over her eyes. It starts at home. Discuss what your children are learning. Ask questions, get them thinking. If you do that the BS has a much harder time sticking.

Sent from my Verizon Wireless 4G LTE DROID

>The other thing going on on this hobby is as pointed out also the "invasion" of microelectronics with the SMD's and integrated circuitry. BUT also we have another field that we need to improved and the basics for the exams are the starting point. WE NEED to at least learn how to build an emergency antenna and a lot of new hams don't know an don't care about this so we are getting a lot of chatting people who don't care about nothing else.
